

NMR for Physical and Biological Scientists
Thomas C. Pochapsky and Susan Sondej Pochapsky
Table of Contents

Preface

Symbols and fundamental constants

1. What is spectroscopy?

A semiclassical description of spectroscopy

Damped harmonics

Quantum oscillators

The spectroscopic experiment

Ensembles and coherence

Types of spectroscopy

Practical considerations in spectroscopy

Acquiring a spectrum

Resolution: the problem of line width

Line shape

Problems

2. Elementary aspects of nuclear magnetic resonance (NMR)

Nuclear and electronic spin

A quantum picture of nuclear spin

The “spinning top” model of nuclear spin

Spin state populations in ensembles

Information available from NMR: 1) Nuclear shielding and chemical shift

Information available from NMR: 2) Scalar coupling

Information available from NMR: 3) Dipolar coupling

Information available from NMR: 4) Dynamics

J-coupling time scale, decoupling experiments and exchange decoupling

Interaction between nuclear spins and radiofrequency EMR: 1) RF decoupling

Problems

NMR for Physical and Biological Scientists
Thomas C. Pochapsky and Susan Sondej Pochapsky
Table of Contents

3. Elementary aspects of NMR II. Fourier Transform NMR

Interaction between nuclear spins and RF: 2) a single spin in the rotating frame of reference

Interaction between nuclear spins and RF: 3) An ensemble of spins in the rotating frame of reference

Detection of an NMR signal

Time-domain detection in the NMR experiment: the free induction decay and quadrature detection

Digitization of the free induction decay

Fourier transformation: time-domain FID to frequency-domain spectrum

Discrete Fourier transformation

Spectral phasing

RF pulses and pulse phase

Pulse power and off-resonance effects from RF pulses

Phase cycling: 1) Improved quadrature detection using CYCLOPS

Factors affecting spectral quality and appearance: shimming, window functions and apodization

After the fact: window functions and zero filling

Linear prediction

Problems

References

4. Nuclear Spin Relaxation and the Nuclear Overhauser Effect

Longitudinal (T_1) relaxation and the sensitivity of the NMR experiment

Transverse (T_2) relaxation and the spin-echo experiment

Chemical shift and J-coupling evolution during the spin echo

Mechanisms of nuclear spin relaxation in liquids and the spectral density function

Dipolar relaxation and the nuclear Overhauser effect

NOE measurements, indirect NOEs and saturation transfer

Heteronuclear NOE and the Solomon equation

NMR for Physical and Biological Scientists
Thomas C. Pochapsky and Susan Sondej Pochapsky
Table of Contents

Other contributions to T_1 relaxation: chemical shift anisotropy, spin-rotation, paramagnetic effects

Quadrupolar relaxation

Selective and non-selective T_1 measurement and multi-exponential decay of coherence

Problems

References

5. Classical and Quantum Descriptions of NMR Experiments in Liquids

The classical approach: the Bloch equations of motion for macroscopic magnetization

Classical description of a pulsed NMR experiment

A quantum mechanical description of NMR of a single spin in an isotropic liquid

A quantum mechanical description of NMR of coupled spins in an isotropic liquid

The time-dependent nuclear spin Hamiltonian operator and solutions to the time-dependent
Schrödinger equation

Problems

References

6. Density Operator and Product Operator Descriptions of NMR Experiments in Liquids

An ensemble of identical spins at equilibrium: an introduction to the density matrix formalism

Expansion of the density matrix for an uncoupled spin in terms of Cartesian angular momentum
operators

Weakly coupled ensembles and the weak coupling approximation

Single-element operators for a two spin system

Interconversion between the single-element and Cartesian operator bases

Evolution of Cartesian operators under the influence of pulses, chemical shift and J-coupling

Evolution of operators with weak J-coupling

Analysis of a simple NMR spectrum using product operators

Problems

References

NMR for Physical and Biological Scientists
Thomas C. Pochapsky and Susan Sondej Pochapsky
Table of Contents

7. Homonuclear Two-dimensional NMR Experiments and Coherence Selection

A simple two-dimensional NMR experiment

Coherence transfer in multidimensional NMR

The COSY experiment

Quadrature detection in multidimensional NMR

Axial peaks

Phase cycling and coherence order selection: the DQF-COSY experiment

Other multiple quantum filters in COSY

Multiple-quantum spectroscopy

Effect of π pulses on coherence

Pulsed field gradients for coherence selection

The gradient COSY experiment

"Zero-quantum filtered COSY": NOESY and incoherent transfer

Rotating frame NOEs: CAMELSPIN and ROESY

Spin-locking experiments for coherence transfer: TOCSY and composite-pulse decoupling

Problems

References

8. Heteronuclear Correlations in NMR

Heteronuclear polarization transfer and the INEPT experiment

Refocused INEPT

Two-dimensional polarization transfer: HETCOR

Sensitive nucleus (inverse) detection of an insensitive nucleus: the double INEPT or HSQC experiment

Multiple quantum approaches to heteronuclear correlation: DEPT and HMQC

Gradient coherence selection in heteronuclear correlation NMR

Phase sensitive gradient coherence selection experiments for heteronuclear correlations

NMR for Physical and Biological Scientists
Thomas C. Pochapsky and Susan Sondej Pochapsky
Table of Contents

Sensitivity enhancement in gradient coherence selection experiments

Problems

References

9. Building blocks for multidimensional NMR and special considerations for biological applications of NMR

Polarization transfer

Solvent suppression

Frequency labeling periods and constant time NMR experiments

Shaped and selective pulses

Composite pulse decoupling and spin-locking

Dealing with very large biomolecules in solution: deuteration and direct ^{13}C detection

Interference patterns in heteronuclear relaxation: TROSY

Problems

References

10. NMR under anisotropic conditions: NMR in the solid state and ordered fluids

Anisotropy in NMR: the chemical shift and dipolar coupling

Resolving the solid state NMR spectrum: magic angle spinning (MAS) and high-power ^1H
decoupling

Cross-polarization for signal enhancement of dilute spins and spin-spin correlations

Selective reintroduction of dipolar couplings between dilute spins: rotational resonance, RFDR
and REDOR

Heteronuclear two-dimensional techniques in solid state NMR

Solid state NMR using oriented samples: PISEMA

Bringing a little order to solution NMR: residual dipolar couplings and chemical shift anisotropy in
ordered fluids

Analysis of residual dipolar couplings

NMR for Physical and Biological Scientists
Thomas C. Pochapsky and Susan Sondej Pochapsky
Table of Contents

Problems

References

11. Relaxation revisited: dynamic processes and paramagnetism

Time scales of molecular motion, dynamic processes and relaxation

The spectral density revisited

Experimental measurement of heteronuclear relaxation parameters in proteins

Model-free analysis of spin relaxation

Chemical exchange and motion on slow and intermediate time scales (10^{-6} s to 10^{-1} s)

Measurement of R_{ex}

Quadrupolar relaxation

Hyperfine interactions and paramagnetic shifts of nuclear spins

Paramagnetic relaxation of nuclear spins

Relaxation and the density matrix

Problems

References

12. Diffusion, imaging and flow

Magnetic field inhomogeneity, $T_{2(\text{macro})}$ and diffusion measurement by NMR

Basic imaging concepts: Phase and frequency encoding of position in a macroscopic sample

Spatially selective pulses

Spatial equivalents of NMR parameters

Basic 2D imaging sequences

k -space

Contrast and contrast agents, relaxation and flow

Rapid-scan MRI: echo-planar imaging and one-shot methods

Problems

References

NMR for Physical and Biological Scientists
Thomas C. Pochapsky and Susan Sondej Pochapsky
Table of Contents

Appendix A. Time-dependent perturbations

The time-dependent Schrödinger equation and superposition states

Hilbert space, eigenvectors and superposition of states

Perturbation theory; time-dependent perturbations of the Hamiltonian

Semiclassical interactions between EMR and quantum oscillators using perturbation theory

Appendix B. Density matrix formalism and the relaxation supermatrix

A density matrix description of the ^1H , ^{15}N HMQC experiment

RF Pulses

Time evolution of the density matrix with chemical shift and coupling

Semiclassical relaxation theory and the Redfield relaxation matrix
