

Detailed Contents

Chapter 1 Introduction to Cells	1		
UNITY AND DIVERSITY OF CELLS	2		
Cells Vary Enormously in Appearance and Function	2		
Living Cells All Have a Similar Basic Chemistry	3		
All Present-Day Cells Have Apparently Evolved from the Same Ancestor	5		
Genes Provide the Instructions for Cellular Form, Function, and Complex Behavior	5		
CELLS UNDER THE MICROSCOPE	6		
The Invention of the Light Microscope Led to the Discovery of Cells	6		
Cells, Organelles, and Even Molecules Can Be Seen Under the Microscope	7		
THE PROCARYOTIC CELL	11		
Prokaryotes Are the Most Diverse of Cells	14		
The World of Prokaryotes Is Divided into Two Domains: Bacteria and Archaea	15		
THE EUKARYOTIC CELL	16		
The Nucleus Is the Information Store of the Cell	16		
Mitochondria Generate Usable Energy from Food to Power the Cell	17		
Chloroplasts Capture Energy from Sunlight	18		
Internal Membranes Create Intracellular Compartments with Different Functions	19		
The Cytosol Is a Concentrated Aqueous Gel of Large and Small Molecules	21		
The Cytoskeleton Is Responsible for Directed Cell Movements	22		
The Cytoplasm Is Far from Static	23		
Eukaryotic Cells May Have Originated as Predators	23		
MODEL ORGANISMS	26		
Molecular Biologists Have Focused on <i>E. coli</i>	27		
Brewer's Yeast Is a Simple Eukaryotic Cell	28		
		<i>Arabidopsis</i> Has Been Chosen Out of 300,000 Species as a Model Plant	28
		The World of Animals Is Represented by a Fly, a Worm, a Fish, a Mouse, and the Human Species	29
		Comparing Genome Sequences Reveals Life's Common Heritage	33
		Essential Concepts	35
		End-of-Chapter Questions	36
		Chapter 2 Chemical Components of Cells	39
		CHEMICAL BONDS	40
		Cells Are Made of Relatively Few Types of Atoms	40
		The Outermost Electrons Determine How Atoms Interact	41
		Ionic Bonds Form by the Gain and Loss of Electrons	44
		Covalent Bonds Form by the Sharing of Electrons	45
		Covalent Bonds Vary in Strength	46
		There Are Different Types of Covalent Bonds	47
		Electrostatic Attractions Help Bring Molecules Together in Cells	47
		Water Is Held Together by Hydrogen Bonds	48
		Some Polar Molecules Form Acids and Bases in Water	49
		MOLECULES IN CELLS	50
		A Cell Is Formed from Carbon Compounds	50
		Cells Contain Four Major Families of Small Organic Molecules	51
		Sugars Are Energy Sources for Cells and Subunits of Polysaccharides	52
		Fatty Acids Are Components of Cell Membranes	54
		Amino Acids Are the Subunits of Proteins	55
		Nucleotides Are the Subunits of DNA and RNA	56

MACROMOLECULES IN CELLS	58	NADH and NADPH Are Important Electron Carriers	107
Macromolecules Contain a Specific Sequence of Subunits	59	Cells Make Use of Many Other Activated Carrier Molecules	109
Noncovalent Bonds Specify the Precise Shape of a Macromolecule	59	The Synthesis of Biological Polymers Requires an Energy Input	110
Noncovalent Bonds Allow a Macromolecule to Bind Other Selected Molecules	63	Essential Concepts	114
Essential Concepts	78	End-of-Chapter Questions	115
End-of-Chapter Questions	79		
Chapter 3 Energy, Catalysis, and Biosynthesis	81	Chapter 4 Protein Structure and Function	119
THE USE OF ENERGY BY CELLS	82	THE SHAPE AND STRUCTURE OF PROTEINS	121
Biological Order Is Made Possible by the Release of Heat Energy from Cells	82	The Shape of a Protein Is Specified by Its Amino Acid Sequence	121
Photosynthetic Organisms Use Sunlight to Synthesize Organic Molecules	84	Proteins Fold into a Conformation of Lowest Energy	124
Cells Obtain Energy by the Oxidation of Organic Molecules	86	Proteins Come in a Wide Variety of Complicated Shapes	125
Oxidation and Reduction Involve Electron Transfers	87	The α Helix and the β Sheet Are Common Folding Patterns	127
		Helices Form Readily in Biological Structures	131
FREE ENERGY AND CATALYSIS	88	β Sheets Form Rigid Structures at the Core of Many Proteins	132
Enzymes Lower the Energy Barriers That Prevent Chemical Reactions from Occurring	89	Proteins Have Several Levels of Organization	133
The Free-Energy Change for a Reaction Determines Whether It Can Occur	91	Few of the Many Possible Polypeptide Chains Will Be Useful	134
The Concentration of Reactants Influences the Free-Energy Change and a Reaction's Direction	92	Proteins Can Be Classified into Families	135
The Standard Free-Energy Change Makes it Possible to Compare the Energetics of Different Reactions	92	Large Protein Molecules Often Contain More Than One Polypeptide Chain	135
Cells Exist in a State of Chemical Disequilibrium	92	Proteins Can Assemble into Filaments, Sheets, or Spheres	136
The Equilibrium Constant is Directly Proportional to ΔG°	93	Some Types of Proteins Have Elongated Fibrous Shapes	138
In Complex Reactions, the Equilibrium Constant Depends on the Concentrations of All Reactants and Products	96	Extracellular Proteins Are Often Stabilized by Covalent Cross-Linkages	138
The Equilibrium Constant Indicates the Strength of Molecular Interactions	96	HOW PROTEINS WORK	140
For Sequential Reactions, the Changes in Free Energy are Additive	97	All Proteins Bind to Other Molecules	140
Rapid Diffusion Allows Enzymes to Find Their Substrates	98	The Binding Sites of Antibodies Are Especially Versatile	142
V_{\max} and K_M Measure Enzyme Performance	99	Enzymes Are Powerful and Highly Specific Catalysts	143
		Lysozyme Illustrates How an Enzyme Works	143
ACTIVATED CARRIER MOLECULES AND BIOSYNTHESIS	104	Most Drugs Inhibit Enzymes	148
The Formation of an Activated Carrier Is Coupled to an Energetically Favorable Reaction	104	Tightly Bound Small Molecules Add Extra Functions to Proteins	148
ATP is the Most Widely Used Activated Carrier Molecule	105	HOW PROTEINS ARE CONTROLLED	149
Energy Stored in ATP is Often Harnessed to Join Two Molecules Together	106	The Catalytic Activities of Enzymes Are Often Regulated by Other Molecules	150
		Allosteric Enzymes Have Binding Sites That Influence One Another	150
		Phosphorylation Can Control Protein Activity by Triggering a Conformational Change	152

GTP-Binding Proteins Are Also Regulated by the Cyclic Gain and Loss of a Phosphate Group	153	Chapter 6 DNA Replication, Repair, and Recombination	197
Nucleotide Hydrolysis Allows Motor Proteins to Produce Large Movements in Cells	154	DNA REPLICATION	198
Proteins Often Form Large Complexes That Function as Protein Machines	155	Base-Pairing Enables DNA Replication	198
Covalent Modification Controls the Location and Assembly of Protein Machines	156	DNA Synthesis Begins at Replication Origins	199
HOW PROTEINS ARE STUDIED	157	New DNA Synthesis Occurs at Replication Forks	203
Cells Can Be Grown in a Culture Dish	157	The Replication Fork Is Asymmetrical	204
Purification Techniques Allow Homogeneous Protein Preparations to Be Obtained from Cell Homogenates	161	DNA Polymerase Is Self-correcting	205
Large Amounts of Almost Any Protein Can be Produced by Genetic Engineering Techniques	163	Short Lengths of RNA Act as Primers for DNA Synthesis	206
Automated Studies of Protein Structure and Function Are Increasing the Pace of Discovery	163	Proteins at a Replication Fork Cooperate to Form a Replication Machine	208
Essential Concepts	168	Telomerase Replicates the Ends of Eucaryotic Chromosomes	210
End-of-Chapter Questions	169	DNA REPAIR	211
Chapter 5 DNA and Chromosomes	171	Mutations Can Have Severe Consequences for a Cell or Organism	211
THE STRUCTURE AND FUNCTION OF DNA	172	A DNA Mismatch Repair System Removes Replication Errors That Escape the Replication Machine	212
A DNA Molecule Consists of Two Complementary Chains of Nucleotides	173	DNA Is Continually Suffering Damage in Cells	213
The Structure of DNA Provides a Mechanism for Heredity	178	The Stability of Genes Depends on DNA Repair	215
THE STRUCTURE OF EUKARYOTIC CHROMOSOMES	179	Double-Strand Breaks Can be Repaired Rapidly But Imperfectly	216
Eukaryotic DNA Is Packaged into Multiple Chromosomes	179	A Record of the Fidelity of DNA Replication and Repair Is Preserved in Genome Sequences	217
Chromosomes Contain Long Strings of Genes	181	HOMOLOGOUS RECOMBINATION	218
Chromosomes Exist in Different States Throughout the Life of a Cell	182	Homologous Recombination Requires Extensive Regions of Sequence Similarity	218
Interphase Chromosomes Are Organized Within the Nucleus	184	Homologous Recombination Can Flawlessly Repair DNA Double-strand Breaks	218
The DNA in Chromosomes Is Highly Condensed	184	Homologous Recombination Exchanges Genetic Information During Meiosis	220
Nucleosomes Are the Basic Units of Eucaryotic Chromosome Structure	185	MOBILE GENETIC ELEMENTS AND VIRUSES	221
Chromosome Packing Occurs on Multiple Levels	187	Mobile Genetic Elements Encode the Components They Need for Movement	222
THE REGULATION OF CHROMOSOME STRUCTURE	188	The Human Genome Contains Two Major Families of Transposable Sequences	222
Changes in Nucleosome Structure Allow Access to DNA	188	Viruses Are Fully Mobile Genetic Elements That Can Escape from Cells	223
Interphase Chromosomes Contain Both Condensed and More Extended Forms of Chromatin	190	Retroviruses Reverse the Normal Flow of Genetic Information	225
Changes in Chromatin Structure Can Be Inherited	191	Essential Concepts	227
Essential Concepts	192	End-of-Chapter Questions	228
End-of-Chapter Questions	193	Chapter 7 From DNA to Protein: How Cells Read the Genome	231
		FROM DNA TO RNA	232
		Portions of DNA Sequence Are Transcribed into RNA	233
		Transcription Produces RNA Complementary to One Strand of DNA	234

Several Types of RNA Are Produced in Cells	235	Gene Expression Can Be Regulated at Many of the Steps in the Pathway from DNA to RNA to Protein	272
Signals in DNA Tell RNA Polymerase Where to Start and Finish	236	HOW TRANSCRIPTIONAL SWITCHES WORK	273
Initiation of Eucaryotic Gene Transcription Is a Complex Process	238	Transcription Is Controlled by Proteins Binding to Regulatory DNA Sequences	273
Eucaryotic RNA Polymerase Requires General Transcription Factors	239	Transcription Switches Allow Cells to Respond to Changes in the Environment	275
Eucaryotic RNAs Are Transcribed and Processed Simultaneously in the Nucleus	240	Repressors Turn Genes Off, Activators Turn Them On	276
Eucaryotic Genes Are Interrupted by Noncoding Sequences	241	An Activator and a Repressor Control the <i>Lac</i> Operon	277
Introns Are Removed by RNA Splicing	242	Eucaryotic Transcription Regulators Control Gene Expression from a Distance	278
Mature Eucaryotic mRNAs Are Selectively Exported from the Nucleus	243	Packing of Promoter DNA into Nucleosomes Affects Initiation of Transcription	279
mRNA Molecules Are Eventually Degraded by the Cell	244	THE MOLECULAR MECHANISMS THAT CREATE SPECIALIZED CELL TYPES	280
The Earliest Cells May Have Had Introns in Their Genes	245	Eucaryotic Genes Are Regulated by Combinations of Proteins	280
FROM RNA TO PROTEIN	246	The Expression of Different Genes Can Be Coordinated by a Single Protein	281
An mRNA Sequence Is Decoded in Sets of Three Nucleotides	246	Combinatorial Control Can Create Different Cell Types	285
tRNA Molecules Match Amino Acids to Codons in mRNA	247	Stable Patterns of Gene Expression Can Be Transmitted to Daughter Cells	287
Specific Enzymes Couple tRNAs to the Correct Amino Acid	251	The Formation of an Entire Organ Can Be Triggered by a Single Transcription Regulator	288
The RNA Message Is Decoded on Ribosomes	251	POST-TRANSCRIPTIONAL CONTROLS	289
The Ribosome Is a Ribozyme	253	Riboswitches Provide An Economical Solution to Gene Regulation	289
Codons in mRNA Signal Where to Start and to Stop Protein Synthesis	254	The Untranslated Regions of mRNAs Can Control Their Translation	290
Proteins Are Made on Polyribosomes	257	Small Regulatory RNAs Control the Expression of Thousands of Animal and Plant Genes	290
Inhibitors of Procaryotic Protein Synthesis Are Used as Antibiotics	257	RNA Interference Destroys Double-Stranded Foreign RNAs	291
Carefully Controlled Protein Breakdown Helps Regulate the Amount of Each Protein in a Cell	258	Scientists Can Use RNA Interference to Turn Off Genes	292
There Are Many Steps Between DNA and Protein	259	Essential Concepts	293
RNA AND THE ORIGINS OF LIFE	261	End-of-Chapter Questions	294
Life Requires Autocatalysis	261	Chapter 9 How Genes and Genomes Evolve	297
RNA Can Both Store Information and Catalyze Chemical Reactions	261	GENERATING GENETIC VARIATION	298
RNA Is Thought to Predate DNA in Evolution	263	In Sexually Reproducing Organisms, Only Changes to the Germ Line Are Passed Along To Progeny	299
Essential Concepts	264	Point Mutations Are Caused by Failures of the Normal Mechanisms for Copying and Maintaining DNA	300
End-of-Chapter Questions	266	Point Mutations Can Change the Regulation of a Gene	301
Chapter 8 Control of Gene Expression	269		
AN OVERVIEW OF GENE EXPRESSION	270		
The Different Cell Types of a Multicellular Organism Contain the Same DNA	270		
Different Cell Types Produce Different Sets of Proteins	270		
A Cell Can Change the Expression of Its Genes in Response to External Signals	272		

DNA Duplications Give Rise to Families of Related Genes	302	DNA CLONING	333
The Evolution of the Globin Gene Family Shows How Gene Duplication and Divergence Can Give Rise to Proteins Tailored to an Organism and Its Development	304	DNA Ligase Joins DNA Fragments Together to Produce a Recombinant DNA Molecule	334
Whole Genome Duplications Have Shaped the Evolutionary History of Many Species	305	Recombinant DNA Can Be Copied Inside Bacterial Cells	334
New Genes Can Be Generated by Repeating the Same Exon	306	Specialized Plasmid Vectors Are Used to Clone DNA	335
Novel Genes Can Also Be Created by Exon Shuffling	306	Genes Can Be Isolated from a DNA Library	336
The Evolution of Genomes Has Been Accelerated by the Movement of Mobile Genetic Elements	307	cDNA Libraries Represent the mRNA Produced by a Particular Tissue	338
Genes Can Be Exchanged Between Organisms by Horizontal Gene Transfer	308	The Polymerase Chain Reaction Amplifies Selected DNA Sequences	340
RECONSTRUCTING LIFE'S FAMILY TREE	309	DECIPHERING AND EXPLOITING GENETIC INFORMATION	343
Genetic Changes That Provide a Selective Advantage Are Likely to Be Preserved	309	DNA Can Be Rapidly Sequenced	345
Human and Chimpanzee Genomes Are Similar in Organization As Well As in Detailed Sequence	310	Completely Novel DNA Molecules Can Be Constructed	347
Functionally Important Regions Show Up As Islands of Conserved DNA Sequence	310	Rare Proteins Can Be Made in Large Amounts Using Cloned DNA	347
Genome Comparisons Show That Vertebrate Genomes Gain and Lose DNA Rapidly	312	Reporter Genes and <i>In Situ</i> Hybridization Can Reveal When and Where a Gene Is Expressed	350
Sequence Conservation Allows Us to Trace Even the Most Distant Evolutionary Relationships	313	Hybridization on DNA Microarrays Monitors the Expression of Thousands of Genes at Once	352
EXAMINING THE HUMAN GENOME	315	Genetic Approaches Can Reveal the Function of a Gene	354
The Nucleotide Sequence of the Human Genome Shows How Our Genes Are Arranged	316	Animals Can be Genetically Altered	354
Accelerated Changes in Conserved Genome Sequences Help Reveal What Makes Us Human	320	RNA Interference Provides a Simple Way to Test Gene Function	356
Genetic Variation Within the Human Genome Contributes to Our Individuality	320	Transgenic Plants Are Important for Both Cell Biology and Agriculture	357
The Human Genome Contains Copious Information Yet to Be Deciphered	321	Essential Concepts	358
Essential Concepts	323	End-of-Chapter Questions	360
End-of-Chapter Questions	324	Chapter 11 Membrane Structure	363
Chapter 10 Analyzing Genes and Genomes	327	THE LIPID BILAYER	364
MANIPULATING AND ANALYZING DNA MOLECULES	329	Membrane Lipids Form Bilayers in Water	365
Restriction Nucleases Cut DNA Molecules at Specific Sites	329	The Lipid Bilayer Is a Two-dimensional Fluid	368
Gel Electrophoresis Separates DNA Fragments of Different Sizes	330	The Fluidity of a Lipid Bilayer Depends on Its Composition	369
Hybridization Provides a Sensitive Way to Detect Specific Nucleotide Sequences	332	The Lipid Bilayer Is Asymmetrical	370
Hybridization Is Carried Out Using DNA Probes Designed to Recognize a Desired Nucleotide Sequence	332	Lipid Asymmetry Is Preserved During Membrane Transport	371
		MEMBRANE PROTEINS	372
		Membrane Proteins Associate with the Lipid Bilayer in Various Ways	373
		A Polypeptide Chain Usually Crosses the Bilayer as an α Helix	374
		Membrane Proteins Can Be Solubilized in Detergents and Purified	375
		The Complete Structure Is Known for Relatively Few Membrane Proteins	376
		The Plasma Membrane Is Reinforced by the Cell Cortex	377

Cells Can Restrict the Movement of Membrane Proteins	379	Transmitter-gated Channels in Target Cells Convert Chemical Signals Back into Electrical Signals	415
The Cell Surface Is Coated with Carbohydrate	380	Neurons Receive Both Excitatory and Inhibitory Inputs	417
Essential Concepts	384	Transmitter-gated Ion Channels Are Major Targets for Psychoactive Drugs	418
End-of-Chapter Questions	385	Synaptic Connections Enable You to Think, Act, and Remember	419
Chapter 12 Membrane Transport	387	Essential Concepts	420
PRINCIPLES OF MEMBRANE TRANSPORT	388	End-of-Chapter Questions	421
The Ion Concentrations Inside a Cell Are Very Different from Those Outside	388	Chapter 13 How Cells Obtain Energy from Food	425
Lipid Bilayers Are Impermeable to Solutes and Ions	389	THE BREAKDOWN AND UTILIZATION OF SUGARS AND FATS	426
Membrane Transport Proteins Fall into Two Classes: Transporters and Channels	389	Food Molecules Are Broken Down in Three Stages	426
Solutes Cross Membranes by Passive or Active Transport	390	Glycolysis Is a Central ATP-producing Pathway	427
TRANSPORTERS AND THEIR FUNCTIONS	391	Fermentations Allow ATP to Be Produced in the Absence of Oxygen	432
Concentration Gradients and Electrical Forces Drive Passive Transport	392	Glycolysis Illustrates How Enzymes Couple Oxidation to Energy Storage	433
Active Transport Moves Solutes Against Their Electrochemical Gradients	393	Sugars and Fats Are Both Degraded to Acetyl CoA in Mitochondria	436
Animal Cells Use the Energy of ATP Hydrolysis to Pump Out Na ⁺	394	The Citric Acid Cycle Generates NADH by Oxidizing Acetyl Groups to CO ₂	436
The Na ⁺ -K ⁺ Pump Is Driven by the Transient Addition of a Phosphate Group	394	Many Biosynthetic Pathways Begin with Glycolysis or the Citric Acid Cycle	439
The Na ⁺ -K ⁺ Pump Helps Maintain the Osmotic Balance of Animal Cells	396	Electron Transport Drives the Synthesis of the Majority of the ATP in Most Cells	444
Intracellular Ca ²⁺ Concentrations Are Kept Low by Ca ²⁺ Pumps	397	REGULATION OF METABOLISM	445
Coupled Transporters Exploit Gradients to Take Up Nutrients Actively	398	Catabolic and Anabolic Reactions Are Organized and Regulated	445
H ⁺ Gradients Are Used to Drive Membrane Transport in Plants, Fungi, and Bacteria	400	Feedback Regulation Allows Cells to Switch from Glucose Degradation to Glucose Biosynthesis	447
ION CHANNELS AND THE MEMBRANE POTENTIAL	400	Cells Store Food Molecules in Special Reservoirs to Prepare for Periods of Need	448
Ion Channels Are Ion-selective and Gated	401	Essential Concepts	450
Ion Channels Randomly Snap Between Open and Closed States	403	End-of-Chapter Questions	451
Different Types of Stimuli Influence the Opening and Closing of Ion Channels	405	Chapter 14 Energy Generation in Mitochondria and Chloroplasts	453
Voltage-gated Ion Channels Respond to the Membrane Potential	405	Cells Obtain Most of Their Energy by a Membrane-based Mechanism	454
Membrane Potential Is Governed by Membrane Permeability to Specific Ions	407	MITOCHONDRIA AND OXIDATIVE PHOSPHORYLATION	456
ION CHANNELS AND SIGNALING IN NERVE CELLS	409	A Mitochondrion Contains an Outer Membrane, an Inner Membrane, and Two Internal Compartments	456
Action Potentials Provide for Rapid Long-Distance Communication	409	The Citric Acid Cycle Generates High-Energy Electrons	458
Action Potentials Are Usually Mediated by Voltage-gated Na ⁺ Channels	410	A Chemiosmotic Process Converts the Energy From Activated Carrier Molecules into ATP	458
Voltage-gated Ca ²⁺ Channels Convert Electrical Signals into Chemical Signals at Nerve Terminals	415		

The Electron-Transport Chain Pumps Protons Across the Inner Mitochondrial Membrane	460	Chapter 15 Intracellular Compartments and Transport	495
Proton Pumping Creates a Steep Electrochemical Proton Gradient Across the Inner Mitochondrial Membrane	460	MEMBRANE-ENCLOSED ORGANELLES	496
The Electrochemical Proton Gradient Drives ATP Synthesis	461	Eucaryotic Cells Contain a Basic Set of Membrane-enclosed Organelles	496
Coupled Transport Across the Inner Mitochondrial Membrane Is Also Driven by the Electrochemical Proton Gradient	463	Membrane-enclosed Organelles Evolved in Different Ways	498
Oxidative Phosphorylation Produces Most of the Cell's ATP	464	PROTEIN SORTING	500
The Rapid Conversion of ADP to ATP in Mitochondria Maintains a High ATP/ADP Ratio in Cells	465	Proteins Are Imported into Organelles by Three Mechanisms	500
MOLECULAR MECHANISMS OF ELECTRON TRANSPORT AND PROTON PUMPING	466	Signal Sequences Direct Proteins to the Correct Compartment	501
Protons Are Readily Moved by the Transfer of Electrons	466	Proteins Enter the Nucleus Through Nuclear Pores	502
The Redox Potential Is a Measure of Electron Affinities	467	Proteins Unfold to Enter Mitochondria and Chloroplasts	505
Electron Transfers Release Large Amounts of Energy	470	Proteins Enter the Endoplasmic Reticulum While Being Synthesized	505
Metals Tightly Bound to Proteins Form Versatile Electron Carriers	470	Soluble Proteins Are Released into the ER Lumen	507
Cytochrome Oxidase Catalyzes the Reduction of Molecular Oxygen	473	Start and Stop Signals Determine the Arrangement of a Transmembrane Protein in the Lipid Bilayer	508
The Mechanism of H ⁺ Pumping Can Be Studied in Atomic Detail	474	VESICULAR TRANSPORT	510
Respiration Is Amazingly Efficient	475	Transport Vesicles Carry Soluble Proteins and Membrane Between Compartments	510
CHLOROPLASTS AND PHOTOSYNTHESIS	476	Vesicle Budding Is Driven by the Assembly of a Protein Coat	511
Chloroplasts Resemble Mitochondria but Have an Extra Compartment	477	Vesicle Docking Depends on Tethers and SNAREs	512
Chloroplasts Capture Energy from Sunlight and Use It to Fix Carbon	478	SECRETORY PATHWAYS	514
Sunlight Is Absorbed by Chlorophyll Molecules	479	Most Proteins Are Covalently Modified in the ER	514
Excited Chlorophyll Molecules Funnel Energy into a Reaction Center	480	Exit from the ER Is Controlled to Ensure Protein Quality	516
Light Energy Drives the Synthesis of Both ATP and NADPH	481	The Size of the ER Is Controlled by the Amount of Protein that Flows Through It	516
Chloroplasts Can Adjust their ATP Production	483	Proteins Are Further Modified and Sorted in the Golgi Apparatus	517
Carbon Fixation Uses ATP and NADPH to Convert CO ₂ into Sugars	484	Secretory Proteins Are Released from the Cell by Exocytosis	518
Sugars Generated by Carbon Fixation Can Be Stored As Starch or Consumed to Produce ATP	486	ENDOCYTTIC PATHWAYS	522
THE ORIGINS OF CHLOROPLASTS AND MITOCHONDRIA	486	Specialized Phagocytic Cells Ingest Large Particles	522
Oxidative Phosphorylation Might Have Given Ancient Bacteria an Evolutionary Advantage	487	Fluid and Macromolecules Are Taken Up by Pinocytosis	523
Photosynthetic Bacteria Made Even Fewer Demands on Their Environment	488	Receptor-mediated Endocytosis Provides a Specific Route into Animal Cells	524
The Lifestyle of <i>Methanococcus</i> Suggests That Chemiosmotic Coupling Is an Ancient Process	490	Endocytosed Macromolecules Are Sorted in Endosomes	525
Essential Concepts	491	Lysosomes Are the Principal Sites of Intracellular Digestion	526
End-of-Chapter Questions	492	Essential Concepts	527
		End-of-Chapter Questions	529

Chapter 16 Cell Communication	531	Intermediate Filaments Strengthen Cells Against Mechanical Stress	575
GENERAL PRINCIPLES OF CELL SIGNALING	532	The Nuclear Envelope Is Supported by a Meshwork of Intermediate Filaments	576
Signals Can Act over a Long or Short Range	532	MICROTUBULES	577
Each Cell Responds to a Limited Set of Signals, Depending on Its History and Its Current State	534	Microtubules Are Hollow Tubes with Structurally Distinct Ends	578
A Cell's Response to a Signal Can Be Fast or Slow	536	The Centrosome Is the Major Microtubule-organizing Center in Animal Cells	579
Some Hormones Cross the Plasma Membrane and Bind to Intracellular Receptors	537	Growing Microtubules Show Dynamic Instability	580
Some Dissolved Gases Cross the Plasma Membrane and Activate Intracellular Enzymes Directly	538	Microtubules Are Maintained by a Balance of Assembly and Disassembly	581
Cell-Surface Receptors Relay Extracellular Signals via Intracellular Signaling Pathways	539	Microtubules Organize the Interior of the Cell	582
Some Intracellular Signaling Proteins Act as Molecular Switches	541	Motor Proteins Drive Intracellular Transport	583
Cell-Surface Receptors Fall into Three Main Classes	542	Organelles Move Along Microtubules	584
Ion-channel-coupled Receptors Convert Chemical Signals into Electrical Ones	544	Cilia and Flagella Contain Stable Microtubules Moved by Dynein	585
G-PROTEIN-COUPLED RECEPTORS	544	ACTIN FILAMENTS	590
Stimulation of GPCRs Activates G-Protein Subunits	545	Actin Filaments Are Thin and Flexible	591
Some G Proteins Directly Regulate Ion Channels	547	Actin and Tubulin Polymerize by Similar Mechanisms	591
Some G Proteins Activate Membrane-bound Enzymes	547	Many Proteins Bind to Actin and Modify Its Properties	592
The Cyclic AMP Pathway Can Activate Enzymes and Turn On Genes	548	An Actin-rich Cortex Underlies the Plasma Membrane of Most Eucaryotic Cells	594
The Inositol Phospholipid Pathway Triggers a Rise in Intracellular Ca^{2+}	551	Cell Crawling Depends on Actin	594
A Ca^{2+} Signal Triggers Many Biological Processes	552	Actin Associates with Myosin to Form Contractile Structures	597
Intracellular Signaling Cascades Can Achieve Astonishing Speed, Sensitivity, and Adaptability	554	Extracellular Signals Control the Arrangement of Actin Filaments	597
ENZYME-COUPLED RECEPTORS	555	MUSCLE CONTRACTION	599
Activated RTKs Recruit a Complex of Intracellular Signaling Proteins	555	Muscle Contraction Depends on Bundles of Actin and Myosin	599
Most RTKs Activate the Monomeric GTPase Ras	556	During Muscle Contraction Actin Filaments Slide Against Myosin Filaments	600
RTKs Activate PI 3-Kinase to Produce Lipid Docking Sites in the Plasma Membrane	558	Muscle Contraction Is Triggered by a Sudden Rise in Ca^{2+}	602
Some Receptors Activate a Fast Track to the Nucleus	559	Muscle Cells Perform Highly Specialized Functions in the Body	604
Multicellularity and Cell Communication Evolved Independently in Plants and Animals	564	Essential Concepts	605
Protein Kinase Networks Integrate Information to Control Complex Cell Behaviors	564	End-of-Chapter Questions	606
Essential Concepts	567	Chapter 18 The Cell Division Cycle	609
End-of-Chapter Questions	569	OVERVIEW OF THE CELL CYCLE	610
Chapter 17 Cytoskeleton	571	The Eucaryotic Cell Cycle Is Divided into Four Phases	611
INTERMEDIATE FILAMENTS	572	A Cell-Cycle Control System Triggers the Major Processes of the Cell Cycle	612
Intermediate Filaments Are Strong and Ropelike	574	Cell-Cycle Control is Similar in All Eucaryotes	613
		THE CELL-CYCLE CONTROL SYSTEM	613
		The Cell-Cycle Control System Depends on Cyclically Activated Protein Kinases called Cdks	614

The Activity of Cdks Is Also Regulated by Phosphorylation and Dephosphorylation	614	Apoptosis Is Mediated by an Intracellular Proteolytic Cascade	639
Different Cyclin–Cdk Complexes Trigger Different Steps in the Cell Cycle	617	The Death Program Is Regulated by the Bcl2 Family of Intracellular Proteins	641
The Cell-Cycle Control System Also Depends on Cyclical Proteolysis	618	Animal Cells Require Extracellular Signals to Survive, Grow, and Divide	642
Proteins that Inhibit Cdks Can Arrest the Cell Cycle at Specific Checkpoints	618	Animal Cells Require Survival Factors to Avoid Apoptosis	643
S PHASE	620	Mitogens Stimulate Cell Division	644
S-Cdk Initiates DNA Replication and Helps Block Re-Replication	620	Growth Factors Stimulate Cells to Grow	645
Cohesins Help Hold the Sister Chromatids of Each Replicated Chromosome Together	621	Some Extracellular Signal Proteins Inhibit Cell Survival, Division, or Growth	645
DNA Damage Checkpoints Help Prevent the Replication of Damaged DNA	621	Essential Concepts	647
M PHASE	622	End-of-Chapter Questions	649
M-Cdk Drives Entry Into M Phase and Mitosis	622	Chapter 19 Sex and Genetics	651
Condensins Help Configure Duplicated Chromosomes for Separation	623	THE BENEFITS OF SEX	652
The Cytoskeleton Carries Out Both Mitosis and Cytokinesis	624	Sexual Reproduction Involves Both Diploid and Haploid Cells	652
M Phase Is Conventionally Divided into Six Stages	624	Sexual Reproduction Gives Organisms a Competitive Advantage	654
MITOSIS	625	MEIOSIS AND FERTILIZATION	655
Centrosomes Duplicate To Help Form the Two Poles of the Mitotic Spindle	625	Haploid Germ Cells Are Produced From Diploid Cells Through Meiosis	655
The Mitotic Spindle Starts to Assemble in Prophase	628	Meiosis Involves a Special Process of Chromosome Pairing	656
Chromosomes Attach to the Mitotic Spindle at Prometaphase	628	Crossing-Over Can Occur Between Maternal and Paternal Chromosomes	657
Chromosomes Aid in the Assembly of the Mitotic Spindle	630	Chromosome Pairing and Recombination Ensure the Proper Segregation of Homologs	658
Chromosomes Line Up at the Spindle Equator at Metaphase	630	The Second Meiotic Division Produces Haploid Daughter Cells	659
Proteolysis Triggers Sister-Chromatid Separation and the Completion of Mitosis	631	Haploid Cells Contain Reassorted Genetic Information	661
Chromosomes Segregate During Anaphase	631	Meiosis Is Not Flawless	662
Unattached Chromosomes Block Sister-Chromatid Separation	633	Fertilization Reconstitutes a Complete Diploid Genome	663
The Nuclear Envelope Re-forms at Telophase	634	MENDEL AND THE LAWS OF INHERITANCE	664
CYTOKINESIS	634	Mendel Chose to Study Traits That Are Inherited in a Discrete Fashion	665
The Mitotic Spindle Determines the Plane of Cytoplasmic Cleavage	634	Mendel Could Disprove the Alternative Theories of Inheritance	665
The Contractile Ring of Animal Cells Is Made of Actin and Myosin	635	Mendel's Experiments Were the First to Reveal the Discrete Nature of Heredity	666
Cytokinesis in Plant Cells Involves the Formation of a New Cell Wall	636	Each Gamete Carries a Single Allele for Each Character	667
Membrane-Enclosed Organelles Must Be Distributed to Daughter Cells When a Cell Divides	638	Mendel's Law of Segregation Applies to All Sexually Reproducing Organisms	668
CONTROL OF CELL NUMBER AND CELL SIZE	638	Alleles for Different Traits Segregate Independently	669
Apoptosis Helps Regulate Animal Cell Numbers	638	The Behavior of Chromosomes During Meiosis Underlies Mendel's Laws of Inheritance	671

Chromosome Crossovers Can Be Used to Determine the Order of Genes	671	Specific Signals Maintain the Stem-Cell Populations	713
Mutations in Genes Can Cause a Loss of Function Or a Gain of Function	673	Stem Cells Can Be Used to Repair Damaged Tissues	714
Each of Us Carries Many Potentially Harmful Recessive Mutant Alleles	673	Therapeutic Cloning Could Provide a Way to Generate Personalized ES Cells	715
GENETICS AS AN EXPERIMENTAL TOOL	675	CANCER	717
The Classical Approach Begins with Random Mutagenesis	675	Cancer Cells Proliferate, Invade, and Metastasize	718
Genetic Screens Identify Mutants Deficient in Specific Cellular Processes	676	Epidemiology Identifies Preventable Causes of Cancer	718
A Complementation Test Reveals Whether Two Mutations Are in the Same Gene	677	Cancers Develop by an Accumulation of Mutations	719
Single-Nucleotide Polymorphisms (SNPs) Serve as Landmarks for Genetic Mapping	678	Cancer Cells Evolve Properties that Give Them a Competitive Advantage	721
Linked Groups of SNPs Define Haplotype Blocks	682	Many Diverse Types of Genes Are Critical for Cancer	722
Haplotype Blocks Give Clues to our Evolutionary History	683	Colorectal Cancer Illustrates How Loss of a Gene Can Lead to Growth of a Tumor	723
Essential Concepts	684	An Understanding of Cancer Cell Biology Opens the Way to New Treatments	727
End-of-Chapter Questions	685	Essential Concepts	729
Chapter 20 Cellular Communities: Tissues, Stem Cells, and Cancer	689	End-of-Chapter Questions	731
EXTRACELLULAR MATRIX AND CONNECTIVE TISSUES	690		
Plant Cells Have Tough External Walls	691		
Cellulose Microfibrils Give the Plant Cell Wall Its Tensile Strength	692		
Animal Connective Tissues Consist Largely of Extracellular Matrix	693		
Collagen Provides Tensile Strength in Animal Connective Tissues	694		
Cells Organize the Collagen That They Secrete	696		
Integrins Couple the Matrix Outside a Cell to the Cytoskeleton Inside It	696		
Gels of Polysaccharide and Protein Fill Spaces and Resist Compression	698		
EPITHELIAL SHEETS AND CELL JUNCTIONS	700		
Epithelial Sheets Are Polarized and Rest on a Basal Lamina	700		
Tight Junctions Make an Epithelium Leak-proof and Separate Its Apical and Basal Surfaces	701		
Cytoskeleton-linked Junctions Bind Epithelial Cells Robustly to One Another and to the Basal Lamina	703		
Gap Junctions Allow Ions and Small Molecules to Pass from Cell to Cell	705		
TISSUE MAINTENANCE AND RENEWAL	707		
Tissues Are Organized Mixtures of Many Cell Types	709		
Different Tissues Are Renewed at Different Rates	710		
Stem Cells Generate a Continuous Supply of Terminally Differentiated Cells	711
