

DETAILED CONTENTS

Part 1 THE FACTS OF LIFE 1

Chapter 1 Why: Biology by the Numbers 3

1.1	PHYSICAL BIOLOGY OF THE CELL	3
1.1.1	Model Building Requires a Substrate of Biological Facts and Physical (or Chemical) Principles	4
1.2	THE STUFF OF LIFE	4
1.2.1	Organisms Are Constructed from Four Great Classes of Macromolecules	5
1.2.2	Nucleic Acids and Proteins Are Polymer Languages with Different Alphabets	6
1.3	MODEL BUILDING IN BIOLOGY	9
1.3.1	Models as Idealizations	9
1.3.2	Biological Stuff Can Be Idealized Using Many Different Physical Models	10
1.3.3	Cartoons and Models	15
	Biological Cartoons Select Those Features of the Problem Thought to be Essential	15
1.3.4	Quantitative Models Can Be Built by Mathematicizing the Cartoons	18
1.4	QUANTITATIVE MODELS AND THE POWER OF IDEALIZATION	19
1.4.1	On the Springiness of Stuff	19
1.4.2	The Toolbox of Fundamental Physical Models	20
1.4.3	The Role of Estimates	22
1.4.4	On Being Wrong	23
1.4.5	Rules of Thumb: Biology by the Numbers	25
1.5	SUMMARY AND CONCLUSIONS	25
1.6	FURTHER READING	27
1.7	REFERENCES	27

Chapter 2 What and Where: Construction Plans for Cells and Organisms 29

2.1	AN ODE TO <i>E. COLI</i>	29
2.1.1	The Bacterial Standard Ruler	30
	The Bacterium <i>E. coli</i> Will Serve as Our Standard Ruler	30
2.1.2	Taking the Molecular Census	32
	The Cellular Interior Is Highly Crowded with Mean Spacings Between Molecules That Are Comparable to Molecular Dimensions	36
2.1.3	Looking Inside Cells	37
2.1.4	Where Does <i>E. coli</i> Fit?	39
	Biological Structures Exist Over a Huge Range of Scales	39
2.2	CELLS AND STRUCTURES WITHIN THEM	40
2.2.1	Cells: A Rogue's Gallery	40
	Cells Come in a Wide Variety of Shapes and Sizes and with a Huge Range of Functions	41
	Cells from Humans Have a Huge Diversity of Structure and Function	45
2.2.2	The Cellular Interior: Organelles	47
2.2.3	Macromolecular Assemblies: The Whole is Greater than the Sum of the Parts	51
	Macromolecules Come Together to Form Assemblies	51
	Helical Motifs are Seen Repeatedly in Molecular Assemblies	51

	Macromolecular Assemblies Are Arranged in Superstructures	53
2.2.4	Viruses as Assemblies	53
2.2.5	The Molecular Architecture of Cells: From Protein Data Bank (PDB) Files to Ribbon Diagrams	57
	Macromolecular Structure Is Characterized Fundamentally by Atomic Coordinates	57
	Chemical Groups Allow Us to Classify Parts of the Structure of Macromolecules	58
2.3	TELESCOPING UP IN SCALE: CELLS DON'T GO IT ALONE	60
2.3.1	Multicellularity as One of Evolution's Great Inventions	61
	Bacteria Interact to Form Colonies such as Biofilms	61
	Teaming Up in a Crisis: Lifestyle of <i>Dictyostelium discoideum</i>	62
	Multicellular Organisms Have Many Distinct Communities of Cells	64
2.3.2	Cellular Structures from Tissues to Nerve Networks	65
	One Class of Multicellular Structures is the Epithelial Sheets	65
	Tissues Are Collections of Cells and Extracellular Matrix	66
	Nerve Cells Form Complex, Multicellular Complexes	66
2.3.3	Multicellular Organisms	67
	Cells Differentiate During Development Leading to Entire Organisms	68
	The Cells of the Nematode Worm <i>Caenorhabditis elegans</i> Have Been Charted Yielding a Cell-by-Cell Picture of the Organism	69
	Higher-Level Structures Exist as Colonies of Organisms	71
2.4	SUMMARY AND CONCLUSIONS	71
2.5	PROBLEMS	72
2.6	FURTHER READING	73
2.7	REFERENCES	73

Chapter 3 When: Stopwatches at Many Scales 75

3.1	THE HIERARCHY OF TEMPORAL SCALES	75
3.1.1	The Pageant of Biological Processes	77
	Biological Processes Are Characterized by a Huge Diversity of Time Scales	77
3.1.2	The Evolutionary Stopwatch	83
3.1.3	The Cell Cycle and the Standard Clock	87
	The <i>E. coli</i> Cell Cycle Will Serve as Our Standard Stopwatch	87
3.1.4	Three Views of Time in Biology	89
3.2	PROCEDURAL TIME	90
3.2.1	The Machines (or Processes) of the Central Dogma	90
	The Central Dogma Describes the Processes Whereby the Genetic Information Is Expressed Chemically	90
	The Processes of the Central Dogma Are Carried Out by Sophisticated Molecular Machines	91
3.2.2	Clocks and Oscillators	93
	Developing Embryos Divide on a Regular Schedule Dictated by an Internal Clock	94
	Diurnal Clocks Allow Cells and Organisms to Be on Time Everyday	94

5.2	BIOLOGICAL SYSTEMS AS MINIMIZERS	180	6.1.1	A First Look at Ligand—Receptor Binding	219
5.2.1	Equilibrium Models for Out of Equilibrium Systems	180	6.1.2	The Statistical Mechanics of Gene Expression: RNA Polymerase and the Promoter	222
	Equilibrium Models Can Be Used for Nonequilibrium Problems If Certain Processes Happen Much Faster than Others	180		A Simple Model of Gene Expression Is to Consider the Probability of RNA Polymerase Binding at the Promoter	224
5.2.2	Proteins in “Equilibrium”	182		Most Cellular RNA Polymerase Molecules Are Bound to DNA	224
	Protein Structures are Free-Energy Minimizers	183		The Binding Probability of RNA Polymerase to Its Promoter Is a Simple Function of the Number of Polymerase Molecules and the Binding Energy	226
5.2.3	Cells in “Equilibrium”	184	6.1.3	Classic Derivation of the Boltzmann Distribution	227
5.2.4	Mechanical Equilibrium from a Minimization Perspective	184		The Boltzmann Distribution Gives the Probability of Microstates for a System in Contact with a Thermal Reservoir	228
	The Mechanical Equilibrium State Is Obtained by Minimizing the Potential Energy	184	6.1.4	Boltzmann Distribution by Counting	230
5.3	THE MATHEMATICS OF SUPERLATIVES	187		Different Ways of Partitioning Energy Among Particles Have Different Degeneracies	230
5.3.1	The Mathematization of Judgement: Functions and Functionals	188	6.1.5	Boltzmann Distribution by Guessing	232
	Functionals Deliver a Number for Every Function They Are Given	188		Maximizing the Entropy Corresponds to Making a Best Guess When Faced with Limited Information	232
5.3.2	The Calculus of Superlatives	190		Entropy Maximization Can Be Used as a Tool for Statistical Inference	234
	Finding the Maximum and Minimum Values of a Function Requires That We Find Where the Slope of the Function Equals Zero	190		The Boltzmann Distribution Is the Maximum Entropy Distribution in Which the Average Energy Is Prescribed as a Constraint	236
5.4	CONFIGURATIONAL ENERGY	192	6.2	ON BEING IDEAL	237
	In Mechanical Problems, Potential Energy Determines the Equilibrium Structure	192	6.2.1	Average Energy of a Molecule in a Gas	238
5.4.1	Hooke’s Law: Actin to Lipids	195		The Ideal Gas Entropy Reflects the Freedom to Rearrange Molecular Positions and Velocities	238
	There Is a Linear Relation Between Force and Extension of a Beam	195	6.2.2	Free Energy of Dilute Solutions	240
	The Energy to Deform an Elastic Material Is a Quadratic Function of the Strain	196		The Chemical Potential of a Dilute Solution Is a Simple Logarithmic Function of the Concentration	240
5.5	STRUCTURES AS FREE ENERGY MINIMIZERS	198	6.2.3	Osmotic Pressure as an Entropic Spring	242
	The Entropy Is a Measure of the Microscopic Degeneracy of a Macroscopic State	198		Osmotic Pressure Arises from Entropic Effects	242
5.5.1	Entropy and Hydrophobicity	201		Viruses, Membrane-Bound Organelles and Cells are Subject to Osmotic Pressure	244
	Hydrophobicity Results from Depriving Water Molecules of Some of Their Configurational Entropy	201		Osmotic Forces Have Been Used to Measure the Interstrand Interactions of DNA	245
	Amino Acids Can Be Classified According to Their Hydrophobicity	203	6.3	THE CALCULUS OF EQUILIBRIUM APPLIED: LAW OF MASS ACTION	245
	When in Water, Hydrocarbon Tails on Lipids Have an Entropy Cost	203	6.3.1	Law of Mass Action and Equilibrium Constants	246
5.5.2	Gibbs and the Calculus of Equilibrium	204		Equilibrium Constants are Determined by Entropy Maximization	246
	Thermal and Chemical Equilibrium Are Obtained by Maximizing the Entropy	204	6.4	APPLICATIONS OF THE CALCULUS OF EQUILIBRIUM	248
5.5.3	Structure as a Competition	206	6.4.1	A Second Look at Ligand—Receptor Binding	248
	Free Energy Minimization Can Be Thought of as an Alternative Formulation of Entropy Maximization	207	6.4.2	Measuring Ligand—Receptor Binding	250
5.5.4	An Ode to ΔG	208	6.4.3	Beyond Simple Ligand—Receptor Binding: The Hill Function	250
	The Free Energy Reflects a Competition Between Energy and Entropy	208	6.4.4	ATP Power	252
5.6	SUMMARY AND CONCLUSIONS	209		The Energy Released in ATP Hydrolysis Depends Upon the Concentrations of Reactants and Products	253
5.7	APPENDIX: THE EULER—LAGRANGE EQUATIONS, FINDING THE SUPERLATIVE	210	6.5	SUMMARY AND CONCLUSIONS	254
	Finding the Extrema of Functionals is Carried out Using the Calculus of Variations	210	6.6	PROBLEMS	254
	The Euler—Lagrange Equations Let Us Minimize Functionals by Solving Differential Equations	210	6.7	FURTHER READING	256
5.8	PROBLEMS	211	6.8	REFERENCES	256
5.9	FURTHER READING	213			
5.10	REFERENCES	214			
Chapter 6 Entropy Rules!		215	Chapter 7 Two-State Systems: From Ion Channels to Cooperative Binding		
6.1	THE ANALYTICAL ENGINE OF STATISTICAL MECHANICS	215	7.1	MACROMOLECULES WITH MULTIPLE STATES	257
	The Probability of Different Microstates Is Determined by Their Energy	217	7.1.1	The Internal State Variable Idea	257
				The State of a Protein or Nucleic Acid Can Be Characterized Mathematically Using a State Variable	258
			7.1.2	Ion Channels as an Example of Internal State Variables	260
				The Open Probability $\langle\sigma\rangle$ of an Ion Channel Can Be Computed Using Statistical Mechanics	261

7.2	STATE VARIABLE DESCRIPTION OF BINDING	264			
7.2.1	The Gibbs Distribution: Contact with a Particle Reservoir	264			
	The Gibbs Distribution Gives the Probability of Microstates for a System in Contact with a Thermal and a Particle Reservoir	264	8.2.5	PCR, DNA Melting, and DNA Bubbles	307
7.2.2	Simple Ligand—Receptor Binding Revisited	266		DNA Melting Is the Result of Competition Between the Energy Cost and the Entropy Gain of Separating the Two Complementary Strands	308
7.2.3	Phosphorylation as an Example of Two Internal State Variables	267		DNA Melting Temperatures Can Be Estimated Using a Random Walk Model	308
	Phosphorylation Can Change the Energy Balance Between Active and Inactive States	268			
7.2.4	Hemoglobin as a Case Study in Cooperativity	269	8.3	THE NEW WORLD OF SINGLE-MOLECULE MECHANICS	311
	The Binding Affinity of Oxygen for Hemoglobin Depends upon Whether or Not Other Oxygens Are Already Bound	270		Single-Molecule Measurement Techniques Lead to Force Spectroscopy	311
	A Toy Model of a Dimeric Hemoglobin (Dimoglobin) Illustrates the Idea of Cooperativity	271	8.3.1	Force—Extension Curves: A New Spectroscopy	311
	The Monod—Wyman—Changeux (MWC) Model Provides a Simple Example of Cooperative Binding	272		Different Macromolecules Have Different Force Signatures When Subjected to Loading	311
	Statistical Models of the Occupancy of Hemoglobin Can Be Written Using Occupation Variables	274	8.3.2	Random Walk Models for Force—Extension Curves	313
	There is a Logical Progression of Increasingly Complex Binding Models for Hemoglobin	274		The Low-Force Regime in Force—Extension Curves Can Be Understood Using the Random Walk Model	313
7.3	SUMMARY AND CONCLUSIONS	278	8.4	PROTEINS AS RANDOM WALKS	317
7.4	PROBLEMS	278	8.4.1	Compact Random Walks and the Size of Proteins	318
7.5	FURTHER READING	279		The Compact Nature of Proteins Leads to an Estimate of their Size	318
7.6	REFERENCES	280	8.4.2	Hydrophobic and Polar Residues: The HP Model	318
				The HP Model Divides Amino Acids into Two Classes: Hydrophobic and Polar	319
			8.4.3	HP Models of Protein Folding	321
			8.5	SUMMARY AND CONCLUSIONS	324
			8.6	PROBLEMS	324
			8.7	FURTHER READING	325
			8.8	REFERENCES	326
	Chapter 8 Random Walks and the Structure of Macromolecules	281		Chapter 9 Electrostatics for Salty Solutions	327
8.1	WHAT IS A STRUCTURE: PDB OR R_C ?	281	9.1	WATER AS LIFE'S AETHER	327
8.1.1	Deterministic vs Statistical Descriptions of Structure	282	9.2	THE CHEMISTRY OF WATER	329
	PDB Files Reflect a Deterministic Description of Macromolecular Structure	282	9.2.1	pH and the Equilibrium Constant	329
	Statistical Descriptions of Structure Emphasize Average Size and Shape Rather Than Atomic Coordinates	282		Dissociation of Water Molecules Reflects a Competition Between the Energetics of Binding and the Entropy of Charge Liberation	329
8.2	MACROMOLECULES AS RANDOM WALKS	282	9.2.2	The Charge on DNA and Proteins	330
	Random Walk Models of Macromolecules View Them as Rigid Segments Connected by Hinges	282		The Charge State of Biopolymers Depends upon the pH of the Solution	330
8.2.1	A Mathematical Stupor	283		Different Amino Acids Have Different Charge States	331
	In Random Walk Models of Polymers, Every Macromolecular Configuration Is Equally Probable	283	9.2.3	Salt and Binding	331
	The Mean Size of a Random Walk Macromolecule Scales as the Square Root of the Number of Segments, N	283			
	The Probability of a Given Macromolecular Configuration Depends Upon Its Microscopic Degeneracy	285	9.3	ELECTROSTATICS FOR SALTY SOLUTIONS	332
	Entropy Determines the Elastic Properties of Polymer Chains	286	9.3.1	An Electrostatics Primer	332
	The Persistence Length Is a Measure of the Length Scale Over Which a Polymer Remains Roughly Straight	289		A Charge Distribution Produces an Electric Field Throughout Space	333
8.2.3	How Big Is a Genome?	291		The Flux of the Electric Field Measures the Density of Electric Field Lines	333
8.2.4	The Geography of Chromosomes	292		The Electrostatic Potential Is an Alternative Basis for Describing the Electrical State of a System	336
	Genetic Maps and Physical Maps of Chromosomes Describe Different Aspects of Chromosome Structure	292		There Is an Energy Cost Associated With Assembling a Collection of Charges	338
	Different Structural Models of Chromatin Are Characterized by the Linear Packing Density of DNA	293		The Energy to Liberate Ions from Molecules Can Be Comparable to the Thermal Energy	340
	Spatial Organization of Chromosomes Shows Elements of Both Randomness and Order	294	9.3.2	The Charged Life of a Protein	341
	Chromosomes Are Tethered at Different Locations	295	9.3.3	The Notion of Screening: Electrostatics in Salty Solutions	342
	Chromosome Territories Have Been Observed in Bacterial Cells	298		Ions in Solution Are Spatially Arranged to Shield Charged Molecules Such as DNA	342
	Chromosome Territories in <i>Vibrio cholerae</i> Can Be Explained by Models of Polymer Confinement and Tethering	299		The Size of the Screening Cloud Is Determined by a Balance of Energy and Entropy of the Surrounding Ions	343
8.2.4	DNA Looping: From Chromosomes to Gene Regulation	305	9.3.4	The Poisson—Boltzmann Equation	346
				The Distribution of Screening Ions Can Be Found by Minimizing the Free Energy	346

	The Screening Charge Decays Exponentially Around Macromolecules in Solution	348	10.5	THE CYTOSKELETON AND BEAM THEORY	387	
9.3.5	Viruses as Charged Spheres	349		Eukaryotic Cells Are Threaded by Networks of Filaments	388	
9.4	SUMMARY AND CONCLUSION	352	10.5.1	The Cellular Interior: A Structural Perspective	388	
9.5	PROBLEMS	353		Prokaryotic Cells Have Proteins Analogous to the Eukaryotic Cytoskeleton	390	
9.6	FURTHER READING	355	10.5.2	Stiffness of Cytoskeletal Filaments	391	
9.7	REFERENCES	355		The Cytoskeleton Can Be Viewed as a Collection of Elastic Beams	391	
Chapter 10 Beam Theory: Architecture for Cells and Skeletons			357	10.5.3	Cytoskeletal Buckling	393
10.1	BEAMS ARE EVERYWHERE: FROM FLAGELLA TO THE CYTOSKELETON	357		A Beam Subject to a Large Enough Force Will Buckle	393	
	One-Dimensional Structural Elements Are the Basis of Much of Macromolecular and Cellular Architecture	357	10.5.4	Estimate of the Buckling Force	394	
10.2	GEOMETRY AND ENERGETICS OF BEAM DEFORMATION	359		Beam Buckling Occurs at Smaller Forces for Longer Beams	396	
10.2.1	Stretch, Bend, and Twist	359	10.6	BEAMS AND BIOTECHNOLOGY	396	
	Beam Deformations Result in Stretching, Bending, and Twisting	359	10.6.1	Biofunctionalized Cantilevers and Molecular Recognition	397	
	A Bent Beam Can Be Analyzed as a Collection of Stretched Beams	359		Biofunctionalized Cantilevers Can Be Used to Detect Macromolecules, Viruses, and Cells	397	
	The Energy Cost to Deform a Beam Is a Quadratic Function of the Strain	361		Bending of Biofunctionalized Cantilevers Reflects a Competition Between Bending Energy and Surface Free Energy	397	
10.2.2	Beam Theory and the Persistence Length: Stiffness is Relative	363	10.7	SUMMARY AND CONCLUSIONS	399	
	Thermal Fluctuations Tend to Randomize the Orientation of Biological Polymers	363	10.8	APPENDIX: THE MATHEMATICS OF THE WORM-LIKE CHAIN	400	
	The Persistence Length Is the Length Over Which a Polymer Is Roughly Rigid	363	10.9	PROBLEMS	403	
	The Persistence Length Characterizes the Correlations in the Tangent Vectors at Different Positions Along the Polymer	364	10.10	FURTHER READING	405	
	The Persistence Length Is Obtained by Averaging Over All Configurations of the Polymer	364	10.11	REFERENCES	405	
10.2.3	Elasticity and Entropy: The Worm-like Chain	366	Chapter 11 Biological Membranes: Life in Two Dimensions			
	The Worm-like Chain Model Accounts for Both the Elastic Energy and Entropy of Polymer Chains	366	11.1	THE NATURE OF BIOLOGICAL MEMBRANES	407	
10.3	THE MECHANICS OF TRANSCRIPTIONAL REGULATION: DNA LOOPING REDUX	368	11.1.1	Cells and Membranes	407	
10.3.1	The <i>Lac</i> Operon and Other Looping Systems	368		Cells and Their Organelles Are Bound by Complex Membranes	407	
	Transcriptional Regulation Can Be Affected by DNA Looping	369		Electron Microscopy Provides a Window on Cellular Membrane Structures	409	
10.3.2	Energetics of DNA Looping	369	11.1.2	The Chemistry and Shape of Lipids	410	
10.3.3	Putting It All Together: The J-Factor	370		Membranes Are Built from a Variety of Molecules That Have an Ambivalent Relationship with Water	410	
				The Shapes of Lipid Molecules Can Induce Spontaneous Curvature to Membranes	412	
10.4	DNA PACKING: FROM VIRUSES TO EUKARYOTES	372	11.1.3	The Liveliness of Membranes	414	
	The Packing of DNA in Viruses and Cells Requires Enormous Volume Compaction	372		Membrane Proteins Shuttle Mass Across Membranes	415	
10.4.1	The Problem of Viral DNA Packing	374		Membrane Proteins Communicate Information Across Membranes	416	
	Structural Biologists Have Determined the Structure of Many Parts in the Viral Parts List	375		Specialized Membrane Proteins Generate ATP	416	
	The Packing of DNA in Viruses Results in a Free-Energy Penalty	375		Membrane Proteins Can Be Reconstituted in Vesicles	417	
	A Simple Model of DNA Packing in Viruses Uses the Elastic Energy of Circular Hoops	377	11.2	ON THE SPRINGINESS OF MEMBRANES	417	
	DNA Self-Interactions Are also Important in Establishing the Free Energy Associated with DNA Packing in Viruses	379	11.2.1	An Interlude on Membrane Geometry	417	
	DNA Packing in Viruses Is a Competition Between Elastic and Interaction Energies	380		Membrane Stretching Geometry Can Be Described by a Simple Area Function	418	
10.4.2	Constructing the Nucleosome	381		Membrane Bending Geometry Can Be Described by a Simple Height Function, $h(x,y)$	419	
	Nucleosome Formation Involves Both Elastic Deformation and Interactions between Histones and DNA	383		Membrane Compression Geometry Can Be Described by a Simple Thickness Function, $w(x,y)$	422	
10.4.3	Equilibrium Accessibility of Nucleosomal DNA	383		Membrane Shearing Can Be Described by an Angle Variable, θ	422	
	The Equilibrium Accessibility of Sites within the Nucleosome Depends upon How Far They Are from the Unwrapped Ends	384	11.2.2	Free Energy of Membrane Deformation	422	
				There Is a Free Energy Penalty Associated with Changing the Area of a Lipid Bilayer	422	
				There Is a Free Energy Penalty Associated with Bending a Lipid Bilayer	423	
				There Is a Free Energy Penalty for Changing the Thickness of a Lipid Bilayer	424	
				There Is an Energy Cost Associated with the Gaussian Curvature	424	

11.3	STRUCTURE, ENERGETICS, AND FUNCTION OF VESICLES	426	12.4.3	Dissipative Time Scales and the Reynolds Number	471
11.3.1	Measuring Membrane Stiffness	426	12.4.4	Fish Gotta Swim, Birds Gotta Fly, and Bacteria Gotta Swim Too	472
	Membrane Elastic Properties Can Be Measured by Stretching Vesicles	426		Reciprocal Deformation of the Swimmer's Body Does Not Lead to Net Motion at Low Reynolds Number	474
11.3.2	Membrane Pulling	427	12.4.5	Centrifugation and Sedimentation: Spin It Down	475
11.3.3	Vesicles in Cells	431	12.5	SUMMARY AND CONCLUSIONS	477
	Vesicles Are Used for a Variety of Cellular Transport Processes	431	12.6	PROBLEMS	477
	There Is a Fixed Free Energy Cost Associated with Spherical Vesicles of All Sizes	433	12.7	FURTHER READING	479
	Vesicle Formation Is Assisted by Budding Proteins	434	12.8	REFERENCES	479
	There Is an Energy Cost to Disassemble Coated Vesicles	435			
11.3.4	Fusion and Fission	435	Chapter 13 A Statistical View of Biological Dynamics	481	
11.4	MEMBRANES AND SHAPE	436	13.1	DIFFUSION IN THE CELL	481
11.4.1	The Shapes of Organelles	437	13.1.1	Active vs Passive Transport	482
	The Surface Area of Membranes Due to Pleating Is So Large That Organelles Can Have Far More Area than the Plasma Membrane	437	13.1.2	Biological Distances Measured in Diffusion Times	482
	The Time It Takes a Diffusing Molecule to Travel a Distance L Grows as the Square of the Distance	437		Diffusion Is Not Effective Over Large Cellular Distances	484
11.4.2	The Shapes of Cells	439	13.1.3	Random Walk Redux	486
	The Equilibrium Shapes of Red Blood Cells Can Be Found by Minimizing the Free Energy	441	13.2	CONCENTRATION FIELDS AND DIFFUSIVE DYNAMICS	487
11.5	THE ACTIVE MEMBRANE	441		Fick's Law Tells Us How Mass Transport Currents Arise as a Result of Concentration Gradients	488
11.5.1	Mechanosensitive Ion Channels and Membrane Elasticity	441		The Diffusion Equation Results from Fick's Law and Conservation of Mass	490
	Mechanosensitive Ion Channels Respond to Membrane Tension	441	13.2.1	Diffusion by Summing Over Microtrajectories	491
11.5.2	Elastic Deformations of Membranes Produced by Proteins	443	13.2.2	Solutions and Properties of the Diffusion Equation	496
	Proteins Induce Elastic Deformations in the Surrounding Membrane	443		Concentration Profiles Broaden Over Time in a Very Precise Way	496
	Protein-induced Membrane Bending Has an Associated Free-Energy Cost	444	13.2.3	FRAP and FCS	498
11.5.3	One-Dimensional Solution for MscL	444	13.2.4	Drunks on a Hill: The Smoluchowski Equation	502
	Membrane Deformations Can Be Obtained by Minimizing the Membrane Free Energy	444	13.2.5	The Einstein Relation	503
	The Membrane Surrounding a Channel Protein Produces a Line Tension	446	13.3	DIFFUSION TO CAPTURE	505
11.6	SUMMARY AND CONCLUSIONS	450	13.3.1	Modeling the Cell Signaling Problem	506
11.7	PROBLEMS	450		Perfect Receptors Result in a Rate of Uptake $4\pi Dc_0a$	507

Chapter 12 The Mathematics of Water	457		14.1	CROWDING, LINKAGE, AND ENTANGLEMENT	513
12.1	PUTTING WATER IN ITS PLACE	457	14.1.1	The Cell Is Crowded	514
12.2	HYDRODYNAMICS OF WATER AND OTHER FLUIDS	458	14.1.2	Macromolecular Networks: The Cytoskeleton and Beyond	515
12.2.1	Water as a Continuum	458		Crowding on Membranes	517
	Though Fluids Are Comprised of Molecules It Is Possible to Treat Them as a Continuous Medium	458	14.1.4	Consequences of Crowding	517
12.2.2	What Can Newton Tell Us?	458		Crowding Alters Biochemical Equilibria	517
	Gradients in Fluid Velocity Lead to Shear Forces	458		Crowding Alters the Kinetics within Cells	518
12.2.3	$F = ma$ for Fluids	460	14.2	EQUILIBRIA IN CROWDED ENVIRONMENTS	520
12.2.4	The Newtonian Fluid and the Navier—Stokes Equations	463	14.2.1	Crowding and Binding	520
	The Velocity of Fluids at Surfaces Is Zero	464		Lattice Models of Solution Provide a Simple Picture of the Role of Crowding in Biochemical Equilibria	520
12.3	THE RIVER WITHIN: FLUID DYNAMICS OF BLOOD	464	14.2.2	Osmotic Pressures in Crowded Solutions	523
12.3.1	Boats in the River: Leukocyte Rolling and Adhesion	466		Osmotic Pressure Reveals Crowding Effects	523
12.4	THE LOW REYNOLDS NUMBER WORLD	468	14.2.3	Depletion Forces: Order from Disorder	524
12.4.1	Stokes Flow: Consider a Spherical Bacterium	468			
12.4.2	Stokes Drag in Single-Molecule Experiments	470			
	Stokes Drag Is Irrelevant for Optical Tweezers Experiments	470			

The Close Approach of Large Particles Excludes Smaller Particles Between Them, Resulting in an Entropic Force	524	An Equilibrium Polymer Fluctuates in Time	573
Depletion Forces Can Induce Entropic Ordering!	529	15.4.2 Rate Equation Description of Cytoskeletal Polymerization	575
14.2.4 Excluded Volume and Polymers	530	Polymerization Reactions can be described by Rate Equations	575
Excluded Volume Leads to an Effective Repulsion between Molecules	530	The Time Evolution of the Probability Distribution $P_n(t)$ can be Written Using a Rate Equation	577
Self-avoidance Between the Monomers of a Polymer Leads to Polymer Swelling	531	Rates of Addition and Removal of Monomers Are Often Different on the Two Ends of Cytoskeletal Filaments	579
14.3 CROWDED DYNAMICS	533	15.4.3 Nucleotide Hydrolysis and Cytoskeletal Polymerization	581
14.3.1 Crowding and Reaction Rates	533	ATP Hydrolysis Sculpts the Molecular Interface Resulting in Distinct Rates at the Ends of Cytoskeletal Filaments	581
Enzymatic Reactions in Cells Can Proceed Faster than the Diffusion Limit Using Substrate Channeling	533	15.4.4 Dynamic Instability: A Toy Model of the Cap	583
Protein Folding Is Facilitated by Chaperones	534	A Toy Model of Dynamic Instability Assumes That Catastrophe Occurs When Hydrolyzed Nucleotides Are Present at the Growth Front	583
14.3.2 Diffusion in Crowded Environments	535	15.5 SUMMARY AND CONCLUSIONS	586
14.4 SUMMARY AND CONCLUSIONS	536	15.6 PROBLEMS	587
14.5 PROBLEMS	537	15.7 FURTHER READING	588
14.6 FURTHER READING	538	15.8 REFERENCES	588
14.7 REFERENCES	538		
Chapter 15 Rate Equations and Dynamics in the Cell	539	Chapter 16 Dynamics of Molecular Motors	589
15.1 BIOLOGICAL STATISTICAL DYNAMICS: A FIRST LOOK	539	16.1 THE DYNAMICS OF MOLECULAR MOTORS	589
15.1.1 Cells as Chemical Factories	540	16.1.1 Translational Motors: Beating the Diffusive Speed Limit	591
Dynamics of the Cytoskeleton	541	The Motion of Eukaryotic Cilia and Flagella Is Driven by Translational Motors	594
15.2 A CHEMICAL PICTURE OF BIOLOGICAL DYNAMICS	545	Muscle Contraction Is Mediated by Myosin Motors	595
15.2.1 The Rate Equation Paradigm	545	16.1.2 Rotary Motors	600
Chemical Concentrations Vary in Both Space and Time	545	16.1.3 Polymerization Motors: Pushing by Growing	603
Rate Equations Describe the Time Evolution of Concentrations	546	16.1.4 Translocation Motors: Pushing by Pulling	603
15.2.2 All Good Things Must End	546	16.2 RECTIFIED BROWNIAN MOTION AND MOLECULAR MOTORS	605
Macromolecular Decay can be Described by a Simple, First-order Differential Equation	546	16.2.1 The Random Walk Yet Again	605
15.2.3 A Single-Molecule View of Degradation: Statistical Mechanics Over Trajectories	548	Molecular Motors Can Be Thought of as Random Walkers	605
Molecules Fall Apart with a Characteristic Lifetime	548	16.2.2 The One-state Model	606
Decay Processes Can Be Described with Two-state Trajectories	550	The Dynamics of a Molecular Motor Can Be Written Using a Master Equation	607
Decay of One Species Corresponds to Growth in the Number of a Second Species	551	The Driven Diffusion Equation Can Be Transformed into an Ordinary Diffusion Equation	609
15.2.4 Bimolecular Reactions	553	16.2.3 Motor stepping from a free-energy perspective	612
Chemical Reactions Can Increase the Concentration of a Given Species	553	16.2.4 The Two-state Model	616
Equilibrium Constants Have a Dynamical Interpretation in Terms of Reaction Rates	555	The Dynamics of a Two-State Motor Is Described by Two Coupled Rate Equations	617
15.2.5 Dynamics of Ion Channels as a Case Study	555	Internal States Reveal Themselves in the Form of the Waiting Time Distribution	620
Rate Equations for Ion Channels Characterize the Time Evolution of the Open and Closed Probability	556	16.2.5 More General Motor Models	622
15.2.6 Rapid Equilibrium	558	16.2.6 Coordination of Motor Protein Activity	624
Some Chemical Reactions Are Linked Together in a Sequence Resulting in Coupled Rate Equations	559	16.2.7 Rotary Motors	626
15.2.7 Michaelis—Menten and Enzyme Kinetics	563	16.3 Polymerization and Translocation	629
15.3 THE CYTOSKELETON IS ALWAYS UNDER CONSTRUCTION	566	16.3.1 The Polymerization Ratchet	629
15.3.1 The Eukaryotic Cytoskeleton	566	The Polymerization Ratchet Is Based on a Polymerization Reaction That Is Maintained Out of Equilibrium	631
The Cytoskeleton Is a Dynamical Structure That Is Always Under Construction	566	The Polymerization Ratchet Force—Velocity Can Be Obtained by Solving a Driven Diffusion Equation	634
15.3.2 The Curious Case of the Bacterial Cytoskeleton	567	16.3.2 Force Generation by Growth	636
15.4 SIMPLE MODELS OF CYTOSKELETAL POLYMERIZATION	569	Polymerization Forces Can Be Measured Directly	636
The Dynamics of Polymerization Can Involve Many Distinct Physical and Chemical Effects	570	Polymerization Forces Are Used to Center Cellular Structures	638
15.4.1 The Equilibrium Polymer	571	16.3.3 The Translocation Ratchet	639
Equilibrium Models of Cytoskeletal Filaments Describe the Distribution of Polymer Lengths for Simple Polymers	571	Protein Binding Can Speed up Translocation through a Ratcheting Mechanism	639
		The Translocation Time Can Be Estimated by Solving a Driven Diffusion Equation	641

19.2.3	Transcriptional Regulation by the Numbers: Binding Energies and Equilibrium Constants	737
	Equilibrium Constants Can be Used To Determine Regulation Factors	737
19.2.4	A Simple Statistical Mechanics Model of Positive and Negative Regulation	738
19.2.5	The <i>lac</i> Operon	740
	The <i>lac</i> Operon Has Features of Both Negative and Positive Regulation	740
	The Free Energy of DNA Looping Affects the Repression of the <i>lac</i> Operon	743
19.3	REGULATORY DYNAMICS	747
19.3.1	The Dynamics of RNA Polymerase and the Promoter	747
	The Concentrations of Both RNA and Protein Can Be Described Using Rate Equations	747
19.3.2	Genetic Switches: Natural and Synthetic	748
19.3.3	Genetic Networks That Oscillate: The Repressilator	753
19.3.4	Putting Space in the Model: Reaction—Diffusion Models	758
19.4	CELLULAR FAST RESPONSE: SIGNALING	759
19.4.1	Bacterial Chemotaxis	759
19.4.2	Biochemistry on a Leash	764
	Tethering Increases the Local Concentration of a Ligand	764
	Signaling Networks Help Cells Decide When and Where to Grow Their Actin Filaments for Motility	765
	Synthetic Signaling Networks Permit a Dissection of Signaling Pathways	765
19.5	SUMMARY AND CONCLUSIONS	769
19.6	APPENDIX: STABILITY ANALYSIS FOR THE GENETIC SWITCH	769
19.7	PROBLEMS	771
19.8	FURTHER READING	772

SPECIAL SECTIONS

There are four classes of special sections indicated with icons and gray bars throughout the text. They perform order of magnitude estimates, explore the experimental underpinnings of topics, and elaborate on mathematical details.

Estimate

Sizing Up <i>E. coli</i>	33
Sizing Up Yeast	43
Membrane Area of the Endoplasmic Reticulum	49
Sizing Up HIV	55
Sizing Up the Slug and the Fruiting Body	63
Sizing Up Stripes in <i>Drosophila</i> Embryos	68
Sizing Up <i>C. Elegans</i>	70
Timing <i>E. coli</i>	88
Timing the Machines of the Central Dogma	92
Timing Development	105
The Thermal Energy Scale	109
Moving Proteins from Here to There	110
Moving Proteins from Here to There, Part 2	111
Ion Transport Rates in Ion Channels	112
Hemoglobin by the Numbers	125
The Energy Budget Required to Build a Cell	175
Osmotic Pressure in a Cell	244
End-to-End Probability for the <i>E. coli</i> genome	289
The Size of Viral and Bacterial Genomes	291
Chromosome Packing in the Yeast Nucleus	294
Chromosome Organization in <i>C. crescentus</i>	299
DNA Condensation in Bacteriophage $\phi 29$?	339
DNA Condensation in Bacteriophage $\phi 29$ Redux	345
The DNA Packing Compaction Ratio	373
Sizing Up Nucleosomes	381
Sizing up Membrane Heterogeneity	414
Vesicle Counts and Energies in Cells	433
Sizing Up Membrane Area in Mitochondria	438
Blood Flow Through Capillaries	466
Rate of ATP Synthesis in Humans	540
The Rate of Actin Polymerization	542
Equilibrium Polymers?	573
Force Exerted by a Single Motor Step	592
Myosin and Muscle Forces	597
Competition in the ATP Synthase	627
Charge Pumping at Membranes	658
Charge Transfer During Depolarization	662
Genome Size and the Number of Genes	684
Time Scales for Promoter Occupancy and Escape	748

Experiments Behind the Facts

Probing Biological Structure	37
Measurements of Biological Time	80
Genetics	121
Biochemistry	123
Measuring Diffusive Dynamics	485
Taking the Molecular Census	544
Measuring Motor Action	598
Dynamics of Rotary Motors	602
Measuring Gene Expression	724

The Math Behind the Models

The Partial Derivative	190
The Beauty of the Taylor Expansion	193
The Stirling Approximation	200
Counting Arrangements of Particles	216
One Person's Macrostate Is Another's Microstate	229
The Method of Lagrange Multipliers	234
The Gaussian Integral	240
Expanding in Sines and Cosines	303
The Gradient Operator and Vector Calculus	338
Fourth Roots of -1	447
Eigenvalues and Eigenvectors	561

The Tricks Behind the Math

Differentiation with Respect to a Parameter	219
Averaging Sums of Variables	495
Differentiating with Respect to a Parameter	498
Phase Portraits and Vector Fields	752
