

# Detailed Contents

<b>Chapter 1 Living in a Microbial World</b>	<b>1</b>		
<b>The Science of Microbiology</b>	<b>3</b>		
All living things are composed of one or more cells	3		
All living things display other observable characteristics	4		
Microbiology involves the study of several distinct groups of living things	4		
Viruses strain our notion of what it means to be “alive”	7		
Microbiology is closely intertwined with the study of nonmicroorganisms	7		
Microbiology is composed of many specialized subdisciplines	7		
CASE: ART COMES ALIVE?	7		
<b>The Scientific Method</b>	<b>10</b>		
A proper scientific experiment involves a series of well-defined steps	10		
CASE: FLEMING REVISITED	10		
If a hypothesis cannot be disproved, it may eventually become a theory	13		
<b>Coming Up Next...</b>	<b>13</b>		
<b>Key Terms</b>	<b>14</b>		
<b>Concept Questions</b>	<b>14</b>		
<b>Chapter 2 The Chemistry of Life</b>	<b>17</b>		
<b>Atoms: the Basic Building Blocks of Matter</b>	<b>17</b>		
Atoms are made up of smaller components called subatomic particles	18		
As an atom’s stability increases, its energy decreases	19		
An ionic bond is formed when electrons are transferred from one atom to another	20		
		CASE: BACTERIA, SALT, AND CYSTIC FIBROSIS	20
		Covalent bonds form when atoms share electrons in their outermost shells	22
		Covalent bonds can be classified as either polar or nonpolar	22
		<b>The Importance of Water</b>	<b>25</b>
		Acids and bases are compounds that increase or decrease the concentration of protons in water	25
		CASE: FISHLESS IN PENNSYLVANIA	25
		<b>Organic Molecules: the Building Blocks of Life</b>	<b>29</b>
		Carbohydrates function as energy storage and structural molecules	30
		CASE: BACTERIAL HORSE HELPERS	30
		Lipids are relatively hydrophobic molecules, also used for energy storage and structure	33
		Proteins participate in a variety of crucial biological processes	35
		CASE: BAD BAMBOO	35
		Biological reactions require enzymes functioning as catalysts	38
		CASE: CALL IN THE CLOT BUSTERS	38
		Nucleic acids direct the assembly of proteins	40
		<b>Coming Up Next...</b>	<b>41</b>
		<b>Key Terms</b>	<b>42</b>
		<b>Concept Questions</b>	<b>42</b>
		<b>Chapter 3 The Cell: Where Life Begins</b>	<b>45</b>
		<b>Basic Concepts in Cell Biology</b>	<b>46</b>
		As cells get larger, their efficiency decreases	48
		CASE: SIZE DOES MATTER!	48

<b>The Prokaryotic Cell</b>	<b>49</b>	<b>Domain Archaea</b>	<b>79</b>
Many prokaryotes have extracellular structures, extending beyond the cell wall	50	<b>Eukaryotic Microorganisms</b>	<b>80</b>
CASE: PLAQUE ATTACK	50	Protozoa are single-celled organisms within the domain eukarya	81
Most prokaryotes are protected from the exterior environment by a rigid cell wall	52	CASE: THE CAT'S OUT OF THE BAG ON A PROTOZOAN PARASITE	81
CASE: AN OCCUPATIONAL HAZARD	53	Many fungi are involved in disease or ecological processes or are useful for industrial purposes	84
Bacteria with different cell wall types can be distinguished by specific staining techniques	56	CASE: FIRST YOU SHAKE, THEN YOU ACHE	84
Some prokaryotes lack a cell wall	57	Fungi have one of two body plans and can be unicellular or multicellular	86
Each cell is surrounded by a plasma membrane	58	Kingdom Fungi is composed of four phyla	87
The liquid interior of the cell forms the cell's cytoplasm	59	<b>The Viruses</b>	<b>89</b>
CASE: THE ANTHRAX SCARE	60	CASE: "DEATH" IN THE RUE MORGUE	89
<b>The Eukaryotic Cell</b>	<b>62</b>	Most viruses have one of a few basic structures	90
The number of cells in a eukaryotic organism is variable	62	Specific viruses usually infect only certain hosts and certain cells within those hosts	91
While plant and fungal cells have cell walls, animal cells do not	63	Replication of animal viruses proceeds through a series of defined steps	92
Like prokaryotes, all eukaryotic cells are surrounded by a membrane	63	Replication is different for DNA and RNA viruses	95
The cytoplasm of eukaryotic cells contains a variety of membrane-bound organelles	63	Not all viral infections cause symptoms or kill host cells	97
CASE: PARROT FEVER	66	Viruses can damage host cells in several ways	98
<b>Coming Up Next...</b>	<b>68</b>	Like animals, plants are susceptible to many viral infections	99
<b>Key Terms</b>	<b>68</b>	Bacteriophages are viruses that infect bacteria	99
<b>Concept Questions</b>	<b>69</b>	Phages can influence the numbers of bacteria and even the diseases that they cause	101
<b>Chapter 4 A Field Guide to the Microorganisms</b>	<b>71</b>	<b>Prions</b>	<b>102</b>
<b>Taxonomy: How Life Is Classified</b>	<b>71</b>	CASE: LAST LAUGH FOR THE "LAUGHING DEATH"	102
Taxonomy is based on a system of hierarchical groupings	72	<b>Coming Up Next...</b>	<b>104</b>
Modern classification reflects evolutionary relatedness	72	<b>Key Terms</b>	<b>104</b>
DNA analysis provides evidence for relatedness	73	<b>Concept Questions</b>	<b>105</b>
CASE: STREAMS, SNAILS, AND SCHISTOSOMES	74	<b>Chapter 5 The Microbiology of History and the History of Microbiology</b>	<b>107</b>
Kingdoms are organized among three domains	75	<b>If Microbiologists Wrote History</b>	<b>107</b>
<b>Organizing Microorganisms</b>	<b>76</b>	CASE: THE SPANISH CONQUEST OF MEXICO	107
<b>Domain Bacteria</b>	<b>76</b>	Disease influenced important events in ancient Greece and Rome	108
The earliest bacteria were adapted to life on the primitive Earth	77	The Black Death altered European society forever	111
CASE: THE HEAT WAS ON!	77	European explorers imported many diseases into the new world	112
The tree spreads out	78	Several important events of the 19th century owe their outcomes to microorganisms	115
The most recently evolved lineages are found at the farthest branches of the tree	79		

Certain episodes in both World Wars I and II were influenced by microorganisms	117	The environment influences the nature of genetically determined characteristics	153
Some infectious disease is caused by nonmicroorganisms	120	<b>Sources of Genetic Variation</b>	<b>154</b>
<b>The Science of Microbiology: A Brief History</b>	<b>120</b>	Both asexual and sexual organisms are able to generate new genetic combinations	154
CASE: THE ASSASSINATION OF PRESIDENT GARFIELD	120	CASE: GRIFFITH'S TRANSFORMING FACTOR	155
Microorganisms were first discovered in the 17th century	121	Genetic recombination in prokaryotes has great significance for humans	159
The science of microbiology was born in the second half of the 19th century	121	Mutations are the original source of genetic variation	160
The "germ theory of disease" was advanced by the understanding of the need for hospital sanitation	124	CASE: END OF THE LINE FOR A LAST-LINE DEFENSE?	160
The development of pure culture technique allowed rapid advances in microbiology	126	Mutations are caused by many factors	162
Koch was the first to link a specific microorganism to a particular disease	126	Many mutations are repaired before they can affect phenotype	163
The germ theory led to major advances in disease control	127	Mutations are the raw material of evolution	165
With the development of the first vaccines, the field of immunology was born	128	<b>Coming Up Next...</b>	<b>165</b>
Antimicrobial drugs are a 20th century innovation	129	<b>Key Terms</b>	<b>165</b>
Into the modern era	130	<b>Concept Questions</b>	<b>166</b>
<b>Coming Up Next...</b>	<b>130</b>	<b>Chapter 7 Metabolism and Growth</b>	<b>169</b>
<b>Key Terms</b>	<b>130</b>	Metabolism is similar in all living things	170
<b>Concept Questions</b>	<b>131</b>	<b>Basic Concepts</b>	<b>170</b>
<b>Chapter 6 Microbial Genetics</b>	<b>133</b>	Energy released from food molecules is used for other processes that require energy	170
<b>DNA: Structure and Organization</b>	<b>134</b>	Cells convert the energy in biological molecules into ATP	171
DNA is an information molecule	134	Energy is transferred from one molecule to another via oxidation and reduction	172
The structure of DNA is the key to how it functions	135	<b>Cell Respiration</b>	<b>175</b>
DNA is found on chromosomes	137	Carbohydrates are the primary source of energy used in cell respiration	175
<b>DNA Function: Replication</b>	<b>138</b>	Cell respiration occurs in three stages	176
Each DNA molecule can be accurately copied into two new DNA molecules	138	In glycolysis, glucose is partially oxidized, forming two smaller molecules called pyruvate	177
CASE: DNA: FORM SUGGESTS FUNCTION	138	In the Krebs cycle, pyruvate from glycolysis is completely oxidized and the energy released is transferred as electrons to NAD <sup>+</sup> and FAD	178
DNA replication begins at a site called the origin	140	NADH and FADH <sub>2</sub> are oxidized in electron transport, providing the energy for ATP synthesis	179
<b>DNA Function: Genes to Proteins</b>	<b>141</b>	CASE: SOMETHING'S FISHY IN THE FRIDGE	180
A cell's characteristics are largely determined by the proteins that the cell produces	141	Protons that are pumped across a membrane in electron transport provide an energy source for ATP synthesis	182
In transcription, a gene's DNA is used to produce complementary RNA	143	Incomplete glucose oxidation results in fermentation	183
CASE: CHRISTMAS TREES AND TRANSCRIPTION	143	Molecules other than glucose can be used to generate ATP	185
Amino acids are assembled into protein during translation	147		
CASE: PROTEIN SYNTHESIS: DEAD IN ITS TRACKS	147		
Gene activity is often carefully regulated	151		

CASE: NAME THAT BACTERIUM	185	Microorganisms are subject to the laws of natural selection	218
<b>Autotrophs: the Self-feeders</b>	<b>186</b>	CASE: VANCOMYCIN RESISTANCE: THE SEQUEL	218
In photosynthesis, energy in sunlight is used to produce biological molecules	186	Natural selection can influence the virulence of disease-causing organisms	220
Chemoautotrophs use chemical energy the way that photoautotrophs use solar energy	188	CASE: A TALE OF TWO COUNTRIES—AUSTRALIA, ENGLAND, RABBITS, AND THE MYXOMA VIRUS	220
<b>Microbial Metabolism and Growth</b>	<b>188</b>	Microorganisms often influence the evolution of their hosts	222
Microbial growth refers to population growth	189	CASE: ALICE IN WONDERLAND	224
Oxygen, temperature, nutrient levels, and other environmental factors all influence microbial growth rate	191	<b>Coming Up Next...</b>	<b>225</b>
CASE: CANINE FIRST AID	192	<b>Key Terms</b>	<b>226</b>
Microbial populations pass through a sequence of phases called the growth curve	196	<b>Concept Questions</b>	<b>226</b>
As the environment changes, microbial metabolism and therefore the growth curve changes in response	197	<b>Chapter 9 An Ecologist's Guide to Microbiology</b>	<b>229</b>
CASE: MAKING YOGURT	197	<b>Basic Ecological Principles</b>	<b>230</b>
<b>Coming Up Next...</b>	<b>199</b>	Ecology is the study of how living things interact with each other and the environment	230
<b>Key Terms</b>	<b>200</b>	Energy and nutrients are passed between organisms in an ecosystem	230
<b>Concept Questions</b>	<b>200</b>	Nutrients are recycled in an ecosystem, whereas energy is not	232
<b>Chapter 8 Microbial Evolution: The Origin and Diversity of Life</b>	<b>203</b>	<b>Microbial Ecology</b>	<b>232</b>
<b>How Life Began</b>	<b>203</b>	Microorganisms live in microenvironments	233
Conditions on the early Earth were very different than they are today	203	Environmental conditions affect the growth rate of microorganisms	233
The first biological molecules were formed from nonbiological precursors	204	Many microorganisms live in biofilms	234
Genetic information may have originally been encoded in RNA instead of DNA	206	<b>Microbial Habitats: Here, There, Everywhere</b>	<b>235</b>
The first cells required a membrane and genetic material	207	Soil often harbors rich microbial communities	235
The first prokaryotes are thought to have arisen approximately 3.5 billion years ago	208	Many microorganisms are adapted to life in freshwater	238
Certain important metabolic pathways evolved in a defined sequence	208	CASE: WATER BIRDS AND BOTULISM	238
Eukaryotes evolved from prokaryotic ancestors	210	Water pollution can lead to severe oxygen depletion	241
CASE: CELLS WITHIN CELLS	210	CASE: LAKE ERIE: A NEAR-DEATH EXPERIENCE	241
Multicellular life arose from colonies of unicellular eukaryotes	212	Although similar in many ways, the marine environment is distinct from freshwater	242
The origin of viruses is obscure	213	Cloud-dwelling bacteria may be important in promoting rainfall	245
Prions may have arisen from abnormal host proteins	214	<b>Microorganisms and Biogeochemical Cycles</b>	<b>245</b>
Exobiology is the search for extraterrestrial life	214	Carbon moves between living things and the environment	246
<b>Evolution: Explaining Life's Diversity</b>	<b>215</b>	CASE: IRONING OUT GLOBAL WARMING?	246
Natural selection is the driving force of evolution	216	Bacteria convert nitrogen into forms that plants can absorb	248

CASE: THE KEY TO A BOUNTIFUL HARVEST	248	CASE: TROUBLE IN PARADISE	273
Sulfur in organic material is returned to the environment by microorganisms	251	CASE: A RUPTURED APPENDIX	275
Like other cycles, the phosphorus cycle relies on microbial activity	251	Viruses cause disease by interfering with the normal activities of the of the cells they infect	277
<b>Ecological Interactions Involving Microorganisms</b>	<b>253</b>	Different eukaryotic parasites affect their hosts in diverse ways	278
Both organisms in a mutualism benefit from the relationship	253	Pathogens leave the host through a portal of exit	279
In a commensal relationship one organism is benefited while the other is unaffected	254	Symptoms of disease often assist the pathogen in its transmission to a new host	280
Microorganisms in the same environment may compete for certain resources	254	CASE: WHO'S HURTING WHOM?	280
CASE: A MICROSCOPIC DOG-EAT-DOG WORLD	254	<b>Coming Up Next...</b>	<b>281</b>
Some microorganisms are predators	255	<b>Key Terms</b>	<b>282</b>
<b>Coming Up Next...</b>	<b>256</b>	<b>Concept Questions</b>	<b>282</b>
<b>Key Terms</b>	<b>257</b>	<b>Chapter 11 Host Defense</b>	<b>285</b>
<b>Concept Questions</b>	<b>257</b>	When infection cannot be blocked, first innate immunity and then adaptive immunity is activated	286
<b>Chapter 10 The Nature of Disease: A Pathogen's Perspective</b>	<b>259</b>	CASE: INFLUENZA: EXPOSED!	286
<b>Basic Principles of Infectious Disease</b>	<b>260</b>	<b>Barriers to Entry</b>	<b>288</b>
Contact with microorganisms only rarely results in disease	260	CASE: FRED	288
Hosts are colonized with normal microbial flora that is usually harmless	260	CASE: LAURA	290
CASE: SAYONARA SALMONELLA	260	<b>The Innate Immune Response</b>	<b>290</b>
<b>The Process of Infectious Disease</b>	<b>263</b>	If barriers to entry fail, the pathogen is confronted by elements of innate immunity	290
A pathogen must achieve several objectives if it is to cause disease	263	When innate mechanisms fail to eliminate an infection, the adaptive immune response is activated	293
Reservoirs provide a place for pathogens to persist before and after an infection	264	Antigen-presenting cells activate those cells responsible for adaptive immunity	294
CASE: WHAT'S BUGGING KITTY?	264	Antigen-presenting cells migrate to lymphatic organs to activate adaptive immunity	295
The type of reservoir used by a pathogen has implications for disease control	266	<b>The Adaptive Immune Response</b>	<b>296</b>
Pathogens must reach a new host via one or more modes of transmission	268	Antigen-presenting cells activate helper T cells to initiate an adaptive response	296
CASE: REVENGE OF THE BLUE DEVILS	268	Some activated helper T cells activate cytotoxic T cells to initiate a cell-mediated response	298
Pathogens gain access to the host through a portal of entry	270	Helper T cells also activate B cells to initiate a humoral immune response	298
Once they have entered, pathogens must adhere to the host	270	In a humoral response, several different classes of antibodies may be produced	302
Most pathogens must increase in number before they cause disease	271	A successful adaptive response culminates in the elimination of the pathogen	303
Successful pathogens must at least initially evade host defenses	272	An adaptive response is not always successful	304
Bacterial pathogens cause disease in several different ways	272	CASE: BONNIE	304
		Subsequent exposure to the same pathogen results in a stronger and faster adaptive response	304

Vaccines induce immunological memory without causing disease	306	<b>Chapter 13 Epidemiology: Who, What, When, Where, and Why?</b>	<b>343</b>
<b>HIV: A Problem of Immune System Destruction</b>	<b>307</b>	<b>The Birth of Epidemiology</b>	<b>344</b>
CASE: OSCAR	307	The first modern epidemiological study identified cholera as a waterborne disease	344
<b>Host Versus Pathogen: A Summary</b>	<b>311</b>	Florence Nightingale found that improved hygiene reduced the likelihood of typhus	345
<b>Coming Up Next...</b>	<b>312</b>	<b>Epidemics</b>	<b>345</b>
<b>Key Terms</b>	<b>312</b>	A single contaminated site can give rise to a common source epidemic	345
<b>Concept Questions</b>	<b>313</b>	CASE: AN OUTBREAK OF HEPATITIS A	345
<b>Chapter 12 Control of Microbial Growth</b>	<b>315</b>	Host-to-host epidemics are spread from infected to noninfected individuals	347
<b>Physical and Chemical Means of Control</b>	<b>316</b>	Epidemics can occur for biological, environmental, and/or social reasons	347
Physical control of microorganisms involves manipulation of specific environmental factors such as temperature	316	CASE: CAUGHT RED-HANDED—AND WHITE-BEAKED!	347
CASE: COLD, HARD FACTS ABOUT COLD-FILTERED BEER	318	Epidemics become more likely when fewer people in a population are resistant	349
Chemical methods can control microorganisms on living and nonliving material	320	Epidemic outbreaks of influenza occur as the virus changes genetically	352
A variety of chemicals have antiseptic and disinfectant properties	320	CASE: FLU SEASON	352
CASE: WASH YOUR HANDS FIRST!	321	<b>Investigating Disease Outbreaks</b>	<b>355</b>
<b>Antimicrobial Chemotherapy</b>	<b>322</b>	CASE: A NEW BUG ON THE BLOCK	356
An ideal antimicrobial drug inhibits microorganisms without harming the host	323	A case definition helps health authorities determine if unusual cases are related	356
A drug's mode and speed of action, the type of infection being treated, the potential for side effects, and the likelihood of drug resistance all influence drug selection	325	Time, place, and personal characteristics of a new disease provide clues to the disease's identity	357
CASE: A MYSTERY ILLNESS	326	Case-control studies can pinpoint a common risk factor among affected individuals	358
Antibiotics work by interfering with specific bacterial structures or enzymes	328	<b>Emergent Diseases</b>	<b>359</b>
Selective toxicity, while possible, is harder to achieve against eukaryotic pathogens	331	Environmental, biological, behavioral, and social changes can result in emergent diseases	360
Antiviral drugs must interfere with a particular step in the viral replicative cycle	332	Emergent diseases can be categorized as one of four basic types	362
The misuse of antibiotics has led to the problem of drug resistance	335	<b>Bioterrorism</b>	<b>364</b>
CASE: THE IMPORTANCE OF COMPLETING PRESCRIPTIONS	335	<b>Coming Up Next...</b>	<b>364</b>
New strategies provide options for circumventing antibiotic resistance	338	<b>Key Terms</b>	<b>365</b>
<b>Coming Up Next...</b>	<b>339</b>	<b>Concept Questions</b>	<b>365</b>
<b>Key Terms</b>	<b>340</b>	<b>Chapter 14 The Future Is Here: Microorganisms and Biotechnology</b>	<b>367</b>
<b>Concept Questions</b>	<b>340</b>	<b>The Analysis of DNA</b>	<b>368</b>
		Bacterial restriction enzymes have proven useful for cutting DNA at specific sites	368

DNA fragments can be separated by gel electrophoresis	369	In the absence of oxygen, some microorganisms undergo fermentation, releasing specific waste products	401
Southern blotting can be used to identify a specific gene of interest	371	Many plant products can be fermented into various food items	401
CASE: PINPOINTING A CANCER-CAUSING GENE	371	CASE: HOMEMADE WINE	402
Sequencing techniques can be used to reveal the sequence of nucleotides in a DNA sample	373	Fermented milk is the basis of making cheese and yogurt	407
CASE: TB—BC (“BEFORE COLUMBUS,” THAT IS)	374	Certain meat products, including salamis and cured hams, require fermentation	408
Large amounts of specific DNA sequences can be obtained with the polymerase chain reaction	374	<b>Production of Other Foods and Dietary Supplements</b>	<b>408</b>
The Sanger method can be used to sequence a specific sample of DNA	375	Coffee beans are readied for roasting through the use of bacteria	408
The entire genomes of many organisms have been sequenced	376	Many common dietary supplements are produced by microorganisms	408
CASE: <i>E. COLI</i> 'S DARK SIDE	376	CASE: MICROBIAL METABOLITES FOR A FEATHERED FRIEND	408
<b>Genetic Engineering: Whose Gene Is It Anyway?</b>	<b>379</b>	<b>Time to Eat: A Few Microbial Recipes</b>	<b>410</b>
CASE: BIOLOGICAL BLACKMAIL	379	Sauerkraut	410
Genes of interest can be cloned by inserting them into bacteria	379	Pickles	410
DNA from any organism can be maintained in a DNA library	383	Bagels	411
<b>Insights and Applications</b>	<b>384</b>	Yogurt	412
DNA technology has provided better understanding of genes and how they function	384	Greek feta cheese	412
DNA technology has numerous medical, agricultural, and industrial applications	385	Vegemite sandwich	413
CASE: THE MONARCH BUTTERFLY: THE KING IS DEAD OR LONG LIVE THE KING?	389	<b>Coming Up Next...</b>	<b>414</b>
<b>Ethics and Safety</b>	<b>392</b>	<b>Key Terms</b>	<b>414</b>
<b>Coming Up Next...</b>	<b>393</b>	<b>Concept Questions</b>	<b>414</b>
<b>Key Terms</b>	<b>393</b>	<b>Chapter 16 Better Living With Microorganisms: Industrial and Applied Microbiology</b>	<b>417</b>
<b>Concept Questions</b>	<b>393</b>	<b>Commercial Applications</b>	<b>418</b>
<b>Chapter 15 Guess Who’s Coming to Dinner: Microorganisms and Food</b>	<b>395</b>	CASE: UNEARTHING A NEW ANTIBIOTIC	418
<b>The Beginnings of a Beautiful Friendship</b>	<b>396</b>	Many microorganisms produce metabolites with commercial potential	419
CASE: FLIGHT FROM EGYPT	396	Microorganisms producing promising metabolites must often be subjected to strain improvement	419
Microbial activity can help to preserve the quality of some foods	396	Potentially valuable microbes must also grow well in an industrial setting and must not pose undue risks to humans or the environment	421
Fermented dairy products and grains have been used for thousands of years	397	A defined series of steps are followed to move production from the laboratory to the factory	422
<b>Microorganisms and Food Production</b>	<b>398</b>	Many industrially produced microbial metabolites have useful medical applications	423
Some fungi and bacteria are consumed directly as food	398	Industrial microbial metabolites have a wide variety of other, nonmedical uses	425
CASE: WHAT’S FOR TUCKER, MATE?	398		

<b>Big Problems, Little Solutions</b>	<b>426</b>
New strategies are required to combat environmental pollution	427
CASE: THE SWEET SMELL OF SUCCESS	427
Microorganisms are used to digest harmful chemicals through the process of bioremediation	428
Both the environmental context and the microbe being used determine how bioremediation is conducted	429
Bioremediation can prove valuable in many different settings	430
Microorganisms can help reduce solid waste and improve soil quality through composting	431
CASE: WASTE REDUCTION BEGINS AT HOME	431
Plastics may be replaced by biodegradable, microbially produced alternatives	432
Microorganisms may be used to help meet the demand for limited resources	433
Microorganisms may be able to stabilize soil, reducing earthquake damage	436
<b>Coming Up Next...</b>	<b>436</b>
<b>Key Terms</b>	<b>436</b>
<b>Concept Questions</b>	<b>437</b>
