

# List of Headings

## Chapter 1

### The “Brain of the Cell”: Data Processing by Protein Networks

1.1	Metaphors and reductionism: temptations and limitations	1
1.2	Information and signals	3
1.3	Proteins are binary switches	6
1.4	Signal-transducing proteins are “nanoneurons”	9
1.5	Signal-transducing proteins are components of logical gates and neural networks	10
1.6	Privacy versus publicity	11
1.7	Cross talking and network formation	13
1.8	Interaction domains: how the network is plugged together	16
1.9	Generation of signaling patterns	20

## Chapter 2

### Supplying the Network with Energy: Basic Biochemistry of Signal Transduction

2.1	No order without work	25
2.2	Redox and nitrosylation switches: a balance on a narrow ridge	28
2.3	Switches operated by enzymes that hydrolyze energy-rich compounds	32
2.4	GTPase or G-protein switch	32
2.5	ATPase switches	37
2.6	Protein phosphorylation	44
2.7	Protein acetylation: a central device of gene regulation	56
2.8	Protein ubiquitylation: more than a signal of protein degradation	57
2.9	Mono- and poly(ADP-ribosylation)	62
2.10	Ion channel switches: how to make use of electrical charge	64
2.11	Proteolysis switch: protein degradation provides messenger molecules and energy	70
2.12	Receptors: how energy-supplying reactions are combined with signal transduction	70
2.13	Brief summary of experimental standard methods for investigation of signaling pathways: the classical approach	74
2.14	Model organisms for investigation of cellular signal processing	75

## Chapter 3

### Evolution of Cellular Data Processing

3.1	Evolution of biological signal processing	79
3.2	Signal-controlled transport across cell membranes: the ancient way to communicate	82
3.3	Sensor-dependent signal processing: two-component systems	89
3.4	From vagabonds to societies: “bacterial hormones”	109
3.5	From bacteria to humans: evolution of signaling mechanisms	113

## Chapter 4

### Basic Equipment: G-Proteins, Second Messengers, and Protein Kinases

4.1	Stress response and vegetative nervous system	129
4.2	Discovery of intracellular signal transduction	133
4.3	Trimeric G-proteins: coupling of receptors with the protein network	135
4.4	Downstream of G-proteins: enzymes producing second messengers	141
4.5	Guanylate cyclases: not controlled by trimeric G-proteins	166
4.6	The next level: protein kinases as sensors of second messengers	168

## Chapter 5

### Signal Transduction by Receptors with Seven Transmembrane Domains

5.1	An evolutionary model of success	183
5.2	G-protein-coupled receptors: structure and mode of operation	184
5.3	Adrenergic receptors: sensors of stress and sympathetic signals	193
5.4	Muscarinic acetylcholine receptors: sensors of parasympathetic signals	199
5.5	Stress and the heart: the competition between sympathetic and parasympathetic signals	201
5.6	G-protein-coupled receptors activated by proteolysis: major players in blood clotting and inflammation	202

5.7	Adaptation of G-protein-controlled signaling: a matter of feedback	204	8.7	Multiple post-translational modifications of transcription factors: the hypoxic stress response	315	
5.8	Arrestins: multifunctional adaptors for receptor down-modulation and signaling cross talk	206	8.8	Annulment of gene transcription by RNA interference	317	
5.9	Heptahelical receptors without G-protein coupling: hedgehog and Wnt signaling pathways	210	8.9	Post-transcriptional splicing of pre-mRNA: a powerful mechanism to generate variability	318	
5.10	Other G-protein-independent effects of heptahelical receptors: lessons from slime molds and Homer	215				
<b>Chapter 6</b>			<b>Chapter 9</b>			
<b>Signal Transduction by Serine/Threonine Kinase-Coupled Receptors</b>			<b>Signals Controlling mRNA Translation</b>			
6.1	Protein kinase-coupled receptors: the principle of dimerization-driven signal transduction	219	9.1	Eukaryotic mRNA translation: the essentials	325	
6.2	Receptors with intrinsic serine/threonine kinase activity: transforming growth factor $\beta$ receptor family	221	9.2	Release of newly synthesized protein by the endoplasmic reticulum: an ancient playground of G-proteins	327	
6.3	Cytokine receptors associated with serine/threonine kinases: key players in defense reactions	224	9.3	Signaling cascades controlling translation	329	
<b>Chapter 7</b>			9.4	Network for adjustment of cell growth to the supply situation	335	
<b>Signal Transduction by Tyrosine Kinase- and Protein Phosphatase-Coupled Receptors: A Late Invention of Evolution</b>			239	9.5	Synopsis	349
7.1	Receptor tyrosine kinases: the most modern cellular sensors	239	<b>Chapter 10</b>			
7.2	Receptors associated with tyrosine kinases	258	<b>Signal Transduction by Small G-Proteins: The Art of Molecular Targeting</b>			
7.3	Signal transduction by cell adhesion molecules	270	<b>353</b>			
7.4	Protein tyrosine phosphatases and phosphatase-coupled receptors	274	10.1	Ras proteins: generation of order in signal transduction	353	
<b>Chapter 8</b>			10.2	Other G-proteins of the Ras subfamily: an unfinished story	363	
<b>Gene Transcription: The Ultimate Target of Signal Transduction</b>			283	10.3	GTPases of the Rho family: master regulators of the actin cytoskeleton and more	364
8.1	Initiation of transcription	284	10.4	Arf and Rab proteins: control of vesicle transport	377	
8.2	Histones, nucleosomes, and chromatin	287	10.5	Ran, nuclear transport, and mitosis	385	
8.3	Transcription factors as hormone receptors	298	<b>Chapter 11</b>			
8.4	Ligand-controlled transcription factors: xenosensors of the toxic stress response	307	<b>Mitogen-activated Protein Kinase and Nuclear Factor <math>\kappa</math>B Modules</b>			
8.5	Chaperones and peptidyl-prolyl isomerases: how signaling proteins are prepared for work	309	<b>389</b>			
8.6	Transcription factors as substrates of protein kinases	313	11.1	MAP kinase modules: universal relay stations of eukaryotic signal processing	389	
			11.2	MAP kinases and MAP2 kinases: the core of MAP kinase modules	390	
			11.3.	MAP3 kinases: sensors and logical gates of MAP kinase modules	393	
			11.4	MAP4 kinases and G-proteins: lessons learned from yeast	398	
			11.5	Organization of MAP kinase modules by scaffold proteins	400	
			11.6	Downstream of MAP kinase modules: MAP kinase-activated protein kinases	401	

11.7	Downstream of MAP kinase modules: transcription factors	404	14.4	K <sup>+</sup> -selective ion channels: regulators of hyperpolarization and osmotic pressure	486
11.8	NFκB signaling pathway	408	14.5	Calcium ions: the most versatile cellular signals	492
<b>Chapter 12</b>			14.6	Downstream of Ca <sup>2+</sup> signals	510
<b>Cancer and Regulation of Cell Division</b>			14.7	Anion channels	527
12.1	Cancer: a “cellular psychosis”	419	<b>Chapter 15</b>		
12.2	The cell cycle	422	<b>Sensory Signal Processing</b>		
12.3	Cyclins: cell cycle regulators and beyond	424	15.1	Taste	535
12.4	Cyclin-dependent protein kinases: dual control by phosphorylation and dephosphorylation	425	15.2	Mechanical stimuli: touch and sound	539
12.5	Cyclin-dependent kinase inhibitors: keeping the cell cycle under control	427	15.3	Temperature and pain	541
12.6	G <sub>0</sub> cells, restriction points, and the effect of mitogenic signals	428	15.4	Smell	544
12.7	Retinoblastoma proteins: tumor repressors and master regulators of the cell cycle	430	15.5	Vision	546
12.8	Regulation of G <sub>2</sub> phase and G <sub>2</sub> –M transition: precise like clockwork	432	15.6	Sensory adaptation	551
12.9	Genotoxic stress response: a matter of life and death	433	<b>Chapter 16</b>		
12.10	Phases of mitosis	439	<b>Signaling at Synapses: Neurotransmitters and their Receptors</b>		
12.11	Ubiquitin ligase APC/C: giving the beat of mitosis	440	16.1	Neurons and synapses	555
12.12	Mitotic protein kinases: formation of the mitotic spindle	443	16.2	Acetylcholine receptors	565
12.13	Spindle assembly checkpoint: last chance to correct mistakes	445	16.3	γ-Aminobutyric acid and glycine receptors: mediators of inhibitory neurotransmission	569
12.14	Cytokinesis: how a new cell is born	446	16.4	Glutamate receptors: favorites of molecular brain research	573
12.15	Mitotic exit network of yeast	447	16.5	Two gaseous signaling molecules	580
12.16	Ubiquitin ligases	449	16.6	Receptors of purine and pyrimidine nucleotides: the ATP signal	585
<b>Chapter 13</b>			16.7	Cannabinoid and vanilloid receptors	586
<b>Signal Transduction by Proteolysis and Programmed Cell Death</b>			16.8	Opioid receptors	589
13.1	Secretase-coupled receptors: generation of peptide second messengers	455	16.9	Narcotics and drug addiction	590
13.2	Apoptosis: a signal-controlled suicide of cells	464	<b>Chapter 17</b>		
<b>Chapter 14</b>			<b>Putting Together the Pieces: The Approach of Systems Biology</b>		
<b>Signal Transduction by Ions</b>			17.1	Systems biology: origin and focus	600
14.1	Cation channels: prototypical structures and gating mechanisms	478	17.2	System structure: basic network topologies and properties	600
14.2	Voltage-gated Na <sup>+</sup> channels: masters of the action potential	481	17.3	The iterative cycle: laboratory experiments and model building	604
14.3	Epithelial Na <sup>+</sup> channels: regulation of electrolyte balance and induction of action potentials	485	17.4	Problems of quantitative data generation and model building	605
			17.5	Mathematical modeling of a signaling pathway	606
			17.6	Synthetic and predictive biology: the improvement of biological systems	610
