Learning Skills	xxiii		
<b>Chapter 1 Living in a Microbial World</b>	<b>1</b>		
All living things are composed of one or more cells	3		
All living things display other observable characteristics	4		
Microbiology involves the study of several distinct groups of living things	4		
Viruses strain our notion of what it means to be alive	7		
Microbiology is closely intertwined with the study of non-microorganisms	7		
Microbiology is composed of both basic and applied components	7		
<b>Case: Beauty and the bacteria</b>	7		
Both basic and applied microbiology consist of many subdisciplines	9		
A proper scientific experiment involves a series of well-defined steps	10		
<b>Case: Fleming revisited</b>	10		
If a hypothesis cannot be disproved, it may eventually become a theory	13		
Looking back and looking forward	14		
<b>Garland Science Learning System</b>	14		
Concept questions	14		
<b>Chapter 2 The Chemistry of Life</b>	<b>17</b>		
Atoms are the basic building blocks of matter	18		
Atoms are made up of smaller components called subatomic particles	18		
As an atom's stability increases, its energy decreases	19		
An ionic bond is formed when electrons are transferred from one atom to another	21		
		<b>Case: Bacteria, salt, and cystic fibrosis</b>	21
		Covalent bonds form when atoms share electrons in their outermost shells	22
		Covalent bonds can be classified as either polar or nonpolar	23
		Water is essential in life processes	25
		Acids and bases increase or decrease the concentration of protons in water	26
		<b>Case: Stomach pain and stomach bugs</b>	26
		Acidity is measured with the pH scale	28
		Organic molecules are the building blocks of life	28
		Carbohydrates function as energy storage and structural molecules	29
		<b>Case: Bacterial horse helpers</b>	29
		Lipids are relatively hydrophobic molecules and are also used for energy storage and structure	31
		Proteins participate in a variety of crucial biological processes	33
		<b>Case: Bad potatoes</b>	33
		Biological reactions require enzymes functioning as catalysts	36
		<b>Case: Call in the clot busters</b>	36
		Nucleic acids direct the assembly of proteins	37
		Looking back and looking forward	39
		<b>Garland Science Learning System</b>	40
		Concept questions	40
		<b>Chapter 3 The Cell: Where Life Begins</b>	<b>41</b>
		All cells are one of two basic types	42
		Cells can be stained for enhanced observation	44
		As cells get larger, their efficiency decreases	44
		<b>Case: Size does matter!</b>	44
		Prokaryotic cells have a variety of shapes	45

Many prokaryotes have extracellular structures, extending beyond the cell wall	46	<b>Chapter 4 A Field Guide to the Microorganisms</b>	<b>67</b>
<b>Case: Plaque attack</b>	46	Taxonomy is the science of biological classification	67
Many bacteria are surrounded by an excreted layer of polysaccharides	47	Taxonomy is based on a system of hierarchical groupings	68
Structures composed of protein may extend out from the bacterial cell	48	Modern classification reflects evolutionary relatedness	68
Most prokaryotes are protected from the exterior environment by a rigid cell wall	49	DNA analysis provides evidence for relatedness	70
<b>Case: An occupational hazard</b>	50	<b>Case: Streams, snails, and schistosomes</b>	70
The Gram-positive cell wall is composed of multiple layers of carbohydrates, linked by peptides	50	Kingdoms are organized among three domains	72
Gram-negative cells are surrounded by two membranes with a thin peptidoglycan layer in between	51	Microorganisms are found in all three domains of life	73
Acid-fast bacteria are surrounded by a thick, waxy cell wall	53	The domain Bacteria consists of numerous lineages	73
Bacteria with different cell wall types can be distinguished by specific staining techniques	53	The earliest bacteria were adapted to life on the primitive Earth	74
Cell walls surround the cells of most archaea	54	<b>Case: The heat was on!</b>	74
Some prokaryotes lack a cell wall	54	The tree spreads out	75
Each cell is surrounded by a plasma membrane	55	The most recently evolved lineages are found at the farthest branches of the tree	76
The plasma membrane of archaea is often especially stable	56	Although they are prokaryotic, members of domain Archaea are distinct from bacteria	76
The liquid interior of the cell forms the cell's cytoplasm	56	Eukaryotic microorganisms include the protozoa and the fungi	78
The prokaryotic chromosome is usually circular	56	Protozoa are single-celled organisms within the domain Eukarya	79
Proteins are synthesized on the surface of ribosomes	57	<b>Case: The cat's out of the bag on a protozoan parasite</b>	79
Storage granules and inclusion bodies have specialized functions within cells	57	Flagella are used by the flagellates for locomotion	80
Endospores permit survival during times of environmental adversity	57	Amebae move as they extend parts of their cytoplasm	80
<b>Case: The real Jurassic Park</b>	57	The beating of numerous cilia permits locomotion in the ciliates	80
Eukaryotic cells are larger and more complex than prokaryotic cells	59	Apicomplexa typically do not possess structures related to locomotion	81
The number of cells in a eukaryotic organism is variable	59	Many fungi are involved in disease or ecological processes or are useful for industrial purposes	82
While plant and fungal cells have cell walls, animal cells do not	60	Fungi have one of two body plans and can be unicellular or multicellular	83
Like prokaryotes, all eukaryotic cells are surrounded by a membrane	60	The Chytridiomycota represent a primitive phylum of fungi	84
The cytoplasm of eukaryotic cells contains a variety of membrane-bound organelles	61	Zygomycota often form mutualistic relationships with plants	85
DNA is found in the nucleus of eukaryotic cells	61	Like the Zygomycota, many Basidiomycota are important plant mutualists	85
The endomembrane system functions in cellular transport	62	While many are decomposers, other members of the Ascomycota cause serious disease	86
<b>Case: Parrot fever</b>	63	<b>Case: Bad news for bats</b>	86
Chloroplasts and mitochondria function in the production and utilization of energy by the cell	64	Looking back and looking forward	88
Looking forward and looking back	65	<b>Garland Science Learning System</b>	88
<b>Garland Science Learning System</b>	65	Concept questions	88
Concept questions	66		

## Chapter 5 Life's Gray Zone: Viruses and Prions

Viruses are acellular parasites, requiring a host cell in which to replicate	91
Case: "Death" in the Rue Morgue	92
Most viruses have one of a few basic structures	93
Specific viruses usually infect only certain hosts and certain cells within those hosts	94
Replication of animal viruses proceeds through a series of defined steps	95
Viruses must first attach to and enter an appropriate host cell	95
Once they have entered the cell, viruses release their protein coat prior to replication	97
The final two stages are the assembly of new virions and their release from the host cell	97
DNA viruses must replicate their DNA and use it to direct synthesis of viral proteins	98
RNA viruses rely on RNA rather than DNA as their genetic material	99
Retroviruses use their RNA to produce DNA	99
Not all viral infections cause symptoms or kill host cells	100
Viruses damage host cells in several ways	101
Like animals, plants are susceptible to many viral infections	102
Bacteriophages are viruses that infect bacteria	102
Phages can influence the number of bacteria and even the diseases that they cause	104
Prions are infectious proteins	105
Case: Last laugh for the "laughing death"	105
Looking back and looking forward	106
Garland Science Learning System	108
Concept questions	108

## Chapter 6 The Microbiology of History and the History of Microbiology

If microbiologists wrote history...	110
Case: The Spanish conquest of Mexico	110
Disease turned the tide in the Peloponnesian War between Athens and Sparta	110
The fall of the Roman Empire was accelerated by several disease outbreaks	112
The Black Death altered European society forever	113
European explorers imported many diseases into the New World	114
Unlike the Americas, Africa was not fully colonized until the 1900s	116
Several important events of the nineteenth century owe their outcomes to microorganisms	117

Napoleon's dreams of empire were compromised by disease	117
Irish history was irrevocably changed by a disease affecting potatoes	118
French efforts to build a canal in Panama were thwarted by mosquito-borne disease	119
A bacterial metabolic process aided the British navy in World War I	120
Polish doctors spared their villages from World War II's devastation with microbial assistance	121
Some infectious disease is caused by non-microorganisms	121
The science of microbiology has a vibrant history	122
Case: The assassination of President Garfield	122
Microorganisms were first discovered in the seventeenth century	124
The science of microbiology was born in the second half of the nineteenth century	124
The germ theory of disease was advanced by the understanding of the need for hospital sanitation	126
The development of pure culture technique allowed rapid advances in microbiology	127
Koch was the first to link a specific microorganism to a particular disease	127
The germ theory led to major advances in disease control	128
With the development of the first vaccines, the field of immunology was born	129
Antimicrobial drugs are a twentieth century innovation	130
Into the modern era	131
Looking back and looking forward	132
Garland Science Learning System	133
Concept questions	133

## Chapter 7 Microbial Genetics

DNA is an information molecule	135
The structure of DNA is the key to how it functions	136
DNA is found on chromosomes	137
Each DNA molecule can be accurately copied into two new DNA molecules	138
Case: DNA: Form suggests function	138
DNA replication begins at a site called the origin	140
A cell's characteristics are largely determined by the proteins it produces	140
In transcription, a gene's DNA is used to produce complementary RNA	142
Case: Christmas trees and transcription	142
While very similar, transcription in eukaryotes varies from that of bacteria	144

Amino acids are assembled into protein during translation	145	Cell respiration refers to the oxidation of biological molecules	170
<a href="#">Case: Protein synthesis: Dead in its tracks</a>	146	Carbohydrates are the primary source of energy used in cell respiration	170
Gene activity is often carefully regulated	149	Cell respiration occurs in three stages	171
Many bacterial genes are regulated simultaneously in groups of genes called operons	150	In glycolysis, glucose is partially oxidized, forming two smaller molecules called pyruvate	172
Some operons are regulated through repression	151	In the Krebs cycle, pyruvate from glycolysis is completely oxidized and the energy released is transferred as electrons to NAD <sup>+</sup> and FAD	173
Bacteria often coordinate their gene expression through chemical communication	151	NADH and FADH <sub>2</sub> are oxidized in electron transport, providing the energy for ATP synthesis	174
Eukaryotes use various mechanisms to regulate gene expression	152	Different microorganisms may utilize different final electron acceptors	176
The environment influences the nature of genetically determined characteristics	152	<a href="#">Case: No fish for you!</a>	176
Genetic variation can arise through diverse mechanisms	153	Protons that are pumped across a membrane in electron transport provide an energy source for ATP synthesis	177
Sexual reproduction permits the generation of new genetic combinations	153	Incomplete glucose oxidation results in fermentation	178
Horizontal gene transfer allows for genetic recombination in asexually reproducing organisms	154	<a href="#">Case: Driving under the influence (of yeast!)</a>	178
<a href="#">Case: Griffith's transforming factor</a>	155	Molecules other than glucose can be used to generate ATP	180
Transformation relies on the ability of some bacteria to absorb DNA from the environment	156	Autotrophs produce their own biological molecules	180
Viruses may shuttle genes between bacteria	156	In photosynthesis, energy in sunlight is used to produce biological molecules	181
In conjugation, small portions of DNA are transferred directly from one cell to another	157	Chemoautotrophs use chemical energy in the way that photoautotrophs use solar energy	183
Transposons are short DNA sequences that can move from one site in the genome to another	157	Microbial metabolism influences growth rate	184
Genetic recombination in prokaryotes has great significance for humans	158	Microbial growth refers to population growth	184
Mutations are the original source of genetic variation	159	Environmental factors influence microbial growth rate	186
<a href="#">Case: End of the line for a last-line defense?</a>	159	Oxygen affects microbial growth in various ways	186
Mutations are caused by many factors	161	<a href="#">Case: Canine first aid</a>	186
Many mutations are repaired before they can affect phenotype	162	Like oxygen, temperature has a major impact on metabolism and growth	188
Mutations are the raw material of evolution	163	Microorganisms have an optimal environmental pH	190
Looking back and looking forward	163	The growth of most, but not all, microorganisms is inhibited by high salt concentration	190
<a href="#">Garland Science Learning System</a>	164	Like all living things, microbes require certain nutrients to grow efficiently	191
Concept questions	164	Microbial populations pass through a sequence of phases called the growth curve	192
<b>Chapter 8 Metabolism and Growth</b>	<b>165</b>	As the environment changes, microbial metabolism and therefore the growth curve changes in response	193
Metabolism is similar in all living things	166	<a href="#">Case: Making yogurt</a>	193
Energy released from food molecules is used for other processes that require energy	166	Looking back and looking forward	195
Cells convert the energy in biological molecules into ATP	167	<a href="#">Garland Science Learning System</a>	195
Energy is transferred from one molecule to another via oxidation and reduction	168	Concept questions	196
Biological molecules are typically oxidized in a series of small steps	169		

## Chapter 9 Microbial Evolution: The Origin and Diversity of Life

Conditions on the early Earth were very different than they are today	197	Nutrients are recycled in an ecosystem, whereas energy is not	224
The first biological molecules were formed from nonbiological precursors	198	Microbial ecology investigates the role of microorganisms in their environment	225
Genetic information may have originally been encoded in RNA instead of DNA	198	Microorganisms live in microenvironments	225
The first cells required a membrane and genetic material	200	Environmental conditions affect the growth rate of microorganisms	225
The first prokaryotes are thought to have arisen approximately 3.5 billion years ago	201	Many microorganisms live in biofilms	226
Certain important metabolic pathways evolved in a defined sequence	202	Soil often harbors rich microbial communities	228
Eukaryotes evolved from prokaryotic ancestors	203	Microorganisms are found deep below Earth's surface and even inside solid rock	229
<b>Case: Cells within cells</b>	204	Many microorganisms are adapted to life in freshwater	230
Eukaryotic cells first arose from certain archaeal ancestors	206	Many lakes have several distinct ecological zones	230
Multicellular life arose from colonies of unicellular eukaryotes	207	<b>Case: Water birds and botulism</b>	230
The origin of viruses is obscure	208	Rivers and streams have their own unique ecological conditions	233
Prions may have arisen from abnormal host proteins	209	Water pollution can lead to severe oxygen depletion	233
Evolution explains life's diversity	209	<b>Case: Lake Erie: A near-death experience</b>	233
Natural selection is the driving force of evolution	210	Although similar in many ways, the marine environment is distinct from freshwater	234
Microorganisms are subject to the laws of natural selection	212	The littoral zone is typically richer in nutrients than the pelagic zone	235
<b>Case: Vancomycin resistance: The sequel</b>	212	Microbes in the deep sea and benthic zone require specialized adaptations	237
Natural selection can influence the virulence of disease-causing organisms	214	Cloud-dwelling bacteria may be important in promoting rainfall	238
<b>Case: A tale of two countries—Australia, England, rabbits, and the myxoma virus</b>	214	Exobiology is the search for extraterrestrial life	238
Microorganisms often influence the evolution of their hosts	216	Microorganisms are primary driving forces behind biogeochemical cycles	238
Morning sickness may have evolved to protect the developing fetus	216	Carbon moves between living things and the environment	239
Prions may have affected evolution of the brain	217	"Iron fertilization" has been suggested as a way to decrease atmospheric CO <sub>2</sub> levels	240
Bacteria have influenced the formation of insect species	217	Bacteria convert nitrogen into forms that plants can absorb	241
Sex may have evolved in response to selection pressure imposed by pathogens	218	<b>Case: The key to a bountiful harvest</b>	241
<b>Case: Alice in Wonderland</b>	218	Like other cycles, the phosphorus cycle relies on microbial activity	243
Looking back and looking forward	219	Both organisms in a mutualism benefit from the relationship	245
<b>Garland Science Learning System</b>	220	<b>Case: Coral reefs and Darwin's paradox</b>	245
Concept questions	220	In a commensal relationship one organism is benefited while the other is unaffected	246
		Microorganisms in the same environment may compete for certain resources	247
<b>Chapter 10 A Microbiologist's Guide to Ecology</b>	221	<b>Case: A microscopic dog-eat-dog world</b>	247
Ecology is the study of how living things interact with each other and the environment	222	Some microorganisms are predators	248
Energy and nutrients are passed between organisms in an ecosystem	222	Looking back and looking forward	249
		<b>Garland Science Learning System</b>	249
		Concept questions	249

<b>Chapter 11 The Nature of Disease Part I: A Pathogen's Perspective</b>	<b>251</b>	Endotoxins are components of the Gram-negative outer membrane	269
Contact with microorganisms only rarely results in disease	252	<b>Case: A ruptured appendix</b>	269
Hosts are colonized with normal microbiota that is usually harmless	252	Some bacteria produce enzymes with pathogenic properties	270
<b>Case: Sayonara Salmonella</b>	252	Bacterial virulence is sometimes regulated by quorum sensing	270
The microbiota may impact many other host processes	255	Viruses cause disease by interfering with the normal activities of the cells they infect	271
<b>Case: Shy mouse vs courageous mouse</b>	255	Different eukaryotic parasites affect their hosts in diverse ways	272
To cause disease, a pathogen must achieve several objectives	256	Pathogens leave the host through a portal of exit	273
Reservoirs provide a place for pathogens to persist before and after an infection	257	Symptoms of disease often assist the pathogen in its transmission to a new host	274
Many pathogens use animal reservoirs	257	Looking back and looking forward	274
Some pathogens rely at least in part on human reservoirs	258	<b>Garland Science Learning System</b>	274
Some pathogens can survive indefinitely in soil, water, or other environmental reservoirs	259	Concept questions	275
The type of reservoir used by a pathogen has implications for disease control	260	<b>Chapter 12 The Nature of Disease Part II: Host Defense</b>	<b>277</b>
Pathogens must reach a new host via one or more modes of transmission	261	When infection cannot be blocked, first innate immunity and then adaptive immunity is activated	277
<b>Case: Laid low on the high seas</b>	261	<b>Case: Influenza: exposed!</b>	278
Contact transmission may be direct or indirect	261	Plan A: Barriers to entry may prevent infection before it occurs	279
Many pathogens can move through the air in an aerosol released by an infected individual	261	<b>Case: Rob</b>	279
Intestinal pathogens most commonly rely on food- or water-borne transmission	262	Barriers to entry do not always work	281
Vector transmission relies on insects or other invertebrates to transmit infectious organisms	263	<b>Case: Laura</b>	281
Some pathogens can pass from a female to her offspring	263	If barriers to entry fail, the pathogen is confronted by the cells and molecules of innate immunity	282
Pathogens gain access to the host through a portal of entry	263	Inflammation and fever are key components of innate immunity	283
Once they have entered, pathogens must adhere to the host	264	Special chemical messengers help combat viral infections	283
Most pathogens must increase in number before they cause disease	264	When innate mechanisms fail to eliminate an infection, the adaptive immune response is activated	284
Hosts can be infected with multiple pathogens at the same time	265	Antigen-presenting cells activate those cells responsible for adaptive immunity	285
Successful pathogens must at least initially evade host defenses	265	Antigen-presenting cells migrate to lymphatic organs to activate adaptive immunity	286
Pathology can be the result of the host's immune response	265	Antigen-presenting cells activate helper T cells to initiate an adaptive response	287
Bacterial pathogens cause disease in several different ways	266	Some activated helper T cells activate cytotoxic T cells to initiate a cell-mediated response	289
Some pathogenic bacteria produce toxins	266	Helper T cells also activate B cells to initiate a humoral immune response	290
<b>Case: Trouble in paradise</b>	266	In a humoral response, several different classes of antibodies may be produced	292
Exotoxins are bacterial proteins that interfere with cellular processes in specific ways	267	A successful adaptive response culminates in the elimination of the pathogen	293

An adaptive response is not always successful	294	Antibiotics work by interfering with specific bacterial structures or enzymes	321
Case: Bonnie	295	Many antibiotics inhibit cell wall synthesis	322
Subsequent exposure to the same pathogen results in a stronger and faster adaptive response	295	Antiribosomal drugs inhibit bacterial protein synthesis	323
Vaccines induce immunological memory without causing disease	297	Some antibiotics target bacterial DNA	324
HIV is an ongoing public health emergency	299	Selective toxicity, while possible, is harder to achieve against eukaryotic pathogens	324
Case: Oscar	299	Antiviral drugs must interfere with a particular step in the viral replicative cycle	326
HIV causes immune system suppression	300	Acyclovir acts by interfering with viral DNA replication	326
Host versus pathogen: a summary	302	Other viral infections are now amenable to antiviral drug therapy	327
Looking back and looking forward	303	Newer, innovative antiviral drugs are on the horizon	329
Garland Science Learning System	304	Antibiotic misuse has led to the problem of drug resistance	330
Concept questions	304	Case: The importance of completing prescriptions	330
<b>Chapter 13 Control of Microbial Growth</b>	<b>307</b>	Failure to complete a course of antibiotics contributes to resistance	331
Physical control of microorganisms involves manipulation of environmental factors	308	Other forms of antibiotic misuse contribute to resistance	332
Temperature is an effective means to control microbial growth	308	Antibiotic resistance can result in superinfections	333
Case: An army marches on its stomach	308	New strategies provide options for circumventing antibiotic resistance	334
Liquids that cannot tolerate elevated temperatures may be filtered	311	Looking back and looking forward	335
Radiation can be used to kill microorganisms in some situations	311	Garland Science Learning System	336
Certain foods are preserved by drying	312	Concept questions	336
Chemical methods can control microorganisms on living and nonliving material	313	<b>Chapter 14 Epidemiology: Who, What, When, Where, and Why?</b>	<b>337</b>
Various chemicals have antiseptic and disinfectant properties	313	The first modern epidemiological study identified cholera as a water-borne disease	338
Soaps and detergents remove microorganisms from surfaces	314	Florence Nightingale found that improved hygiene reduced the likelihood of typhus	339
Case: Hand washing	314	An epidemic is a sudden increase in the number of cases of a specific disease	340
Heavy metals are toxic to cells	315	A single contaminated site can give rise to a common source epidemic	340
Antimicrobial chemotherapy has led to major improvements in health	315	Case: Food-borne misery	340
An ideal antimicrobial drug inhibits microorganisms without harming the host	316	Host-to-host epidemics spread from infected to uninfected individuals	342
Antibiotics are antimicrobial compounds that were initially produced by microorganisms	317	Epidemics can occur for biological, environmental, and/or social reasons	342
Many factors influence the selection of the most appropriate antibiotic in a given situation	317	Case: Tracking down a feathered felon	342
Some drugs work faster than others	318	Epidemics become more likely when fewer people in a population are resistant	343
Antibiotics are either bactericidal or bacteriostatic	318	Influenza epidemics are a regular occurrence	346
Drugs differ in their spectra of activity	319	Case: Flu season	346
Case: A mystery illness	319	Influenza is an RNA virus with a segmented genome	346
Drug selection may be based on where in the body an infection has occurred	320		
A drug's possible side effects are always an important consideration	321		
Drug resistance is a serious and growing problem	321		

Influenza virus undergoes regular genetic change	347	Genes of interest can be cloned by inserting them into bacteria	373
Genetic drift and shift set the stage for influenza epidemics and pandemics	348	Other types of cloning vectors may be used in certain situations	376
Epidemiological investigations may reveal the causes of new disease outbreaks	349	Powerful new tools for altering genes are becoming available	377
<a href="#">Case: A new bug on the block</a>	350	DNA technology has provided a better understanding of genes and how they function	378
A case definition helps health authorities determine if unusual cases are related	350	DNA technology has numerous medical applications	379
Time, place, and personal characteristics of a new disease provide clues to the disease's identity	351	Vaccines may now be created using recombinant DNA technology	380
Case-control studies can pinpoint a common risk factor among affected individuals	352	Genetic conditions in humans may one day be corrected with gene-editing techniques	381
Emerging and re-emerging diseases are new or changing diseases that are increasing in importance	353	Genetically modified crops are now a reality	382
Zika virus illustrates several important points about disease emergence	354	<a href="#">Case: The monarch butterfly: threats real and imagined</a>	382
Emerging diseases can be categorized as one of four basic types	358	Biotechnology has become routine in many industrial processes	384
Bioterrorism is an ongoing threat	360	Biotechnology raises important ethical and safety concerns	385
<a href="#">Case: The anthrax scare</a>	360	Looking back and looking forward	386
Looking back and looking forward	361	<a href="#">Garland Science Learning System</a>	387
<a href="#">Garland Science Learning System</a>	361	Concept questions	387
Concept questions	362		
		<b>Chapter 16 Guess Who's Coming to Dinner: Microorganisms and Food</b>	<b>389</b>
<b>Chapter 15 The Future Is Here: Microorganisms and Biotechnology</b>	<b>363</b>	The beginnings of a beautiful friendship	390
The genetic revolution began through an understanding of microbial genetic exchange mechanisms	363	<a href="#">Case: Flight from Egypt</a>	390
Sequencing techniques can be used to reveal the sequence of nucleotides in a DNA sample	364	Microbial activity can help to preserve the quality of some foods	390
<a href="#">Case: TB—BC (before Columbus, that is)</a>	365	Fermented dairy products and grains have been used for thousands of years	391
Large amounts of specific DNA sequences can be obtained with the polymerase chain reaction	365	Some fungi and bacteria are consumed directly as food	393
Newer forms of PCR have been developed for specific purposes	366	<a href="#">Case: What's for tucker, mate?</a>	393
Gel electrophoresis can be used to determine if a PCR was successful	366	In the absence of oxygen, some microorganisms undergo fermentation, releasing specific waste products	395
Amplified DNA can be sequenced	367	Flour from grains provide a sugar source in bread-making	395
The entire genomes of many organisms have been sequenced	368	Wine is produced from fermented fruit juice	396
<a href="#">Case: E. Coli's dark side</a>	368	<a href="#">Case: Homemade wine</a>	396
Genetic material taken directly from environmental samples can be sequenced	370	Beer making relies on the fermentation of grains	397
Foreign genes can be introduced into the genomes of different organisms	371	Various other plant materials can be used to produce liquors	398
<a href="#">Case: Biological blackmail</a>	371	A long list of other plant products are fermented to produce popular food items	399
Bacterial restriction enzymes are useful for cutting DNA at specific sites	372	Microbes produce various products used to season or add flavor to food	399
		<a href="#">Case: Vinegar's illustrious past</a>	399

Fermented milk is the basis of making cheese and yogurt	401	Case: Menopause, mares, and microbes	418
Certain meat products require fermentation	403	Microbial metabolites have many other, nonmedical uses	419
Bacteria help to prepare coffee beans for roasting	403	Some microorganisms themselves are used as materials	420
Microbes produce many vitamin supplements	403	New strategies are required to combat environmental pollution	421
Case: Microbial metabolites for a feathered friend	403	Case: The sweet smell of success	421
Amino acids are commercially produced with microbial assistance	404	Microorganisms are used to digest harmful chemicals through the process of bioremediation	422
Certain food items may contribute to a healthy microbiota	404	Both the environmental context and the microbe being used determine how bioremediation is conducted	423
Time to eat: a few microbial recipes	405	Bioremediation can prove valuable in many different settings	424
Looking back and looking forward	409	Bacteria may help solve the solution of plastic waste	425
Garland Science Learning System	409	Fungi can be effective bioremediation agents	425
Concept questions	410	Microorganisms can help reduce solid waste and improve soil quality through composting	426
<b>Chapter 17 Better Living with Microorganisms: Industrial and Applied Microbiology</b>	<b>411</b>	Case: Waste reduction begins at home	426
Microorganisms have numerous commercial applications	412	Plastics may be replaced by biodegradable, microbially produced alternatives	427
Case: Unearthing a new antibiotic	412	Microorganisms may help meet the demand for alternative energy	428
Many microorganisms produce metabolites with commercial potential	413	Looking back and looking forward	431
Microorganisms producing promising metabolites usually must undergo strain improvement	414	Garland Science Learning System	431
Potentially valuable microbes must grow well in an industrial setting and must not pose undue risks to humans or the environment	415	Concept questions	431
A defined series of steps are followed to move production from the laboratory to the factory	415	<b>Glossary</b>	<b>433</b>
Antibiotics are microbial metabolites that are produced commercially	417	<b>Figure acknowledgments</b>	<b>447</b>
Medically valuable steroid hormones can be produced by microorganisms	418	<b>Index</b>	<b>453</b>
